INTRODUCTION

The PARMA WATER LIFTER has been manufactured since 1907. This means you can have confidence in our products based on the many years of reliable performance from PARMA PUMPS. Our engineers are continually seeking improvements and new ideas to make today's PARMA PUMP the most modern and practical pump in the industry. Their simplicity of design and quality construction make them virtually trouble-free pumps that are adaptable to almost any job in agriculture or industry where liquids and semi-liquids need to be moved.

The PARMA PUMP is a submerged type of centrifugal pump which stands in the liquid it is pumping. This fact makes it possible to completely eliminate the suction pipe, foot valve, strainer and packing gland found in most pumps of this type. Since the PARMA PUMP does not require a vacuum inside the bowl, all of these troublesome parts have been left out of its design. It also produces more reliable operation, as weeds, trash, sewage wastes, manufacturing wastes, etc., can pass right through the pump without causing damage or obstructing the flow.

CONDITION OF SALES

1. PRICES -NOTICE

The list prices of all items in this price book cover PARMA COMPANY's standard design and the various parts are constructed of standard materials. All prices are FOB Parma, Idaho and subject to change without notice. Prices charged shall be prices in effect at the time of shipment regardless of date of order.

2. TAXES

These prices do not include sales, use, excise or similar taxes. Consequently, in addition to the price specified herein, the amount of any present or future sales, use excise or other similar tax applicable to the sale of the equipment hereunder shall be paid by the Purchaser, or in lieu thereof, the Purchaser shall provide PARMA COMPANY with a tax exemption certificate acceptable to the taxing authorities.

3. PACKING

Prices include packing for rail or commercial truck shipment only. Any special packing required for export or other means of transportation must be referred to the factory for special pricing.

4. WEIGHTS

Weights given are approximate shipping weights.

5. SHIPMENTS

All promises of shipment are estimates contingent upon strikes, fires or other elements beyond our control. The time of shipment shall be computed from the date when PARMA COMPANY has received, from the Purchaser, a formal order with all and complete details pertaining to the construction of the pump and/or accessories.

6. DESIGN

All designs covered by this catalog are subject to minor modifications by PARMA COMPANY at the time of manufacture to meet the latest price and most efficient operation. If the pumps to be installed are to be used with an existing installation, PARMA COMPANY shall furnish pumps to be interchangeable as near as may be feasible. However, PARMA COMPANY reserves the right to substitute the latest materials and designs.

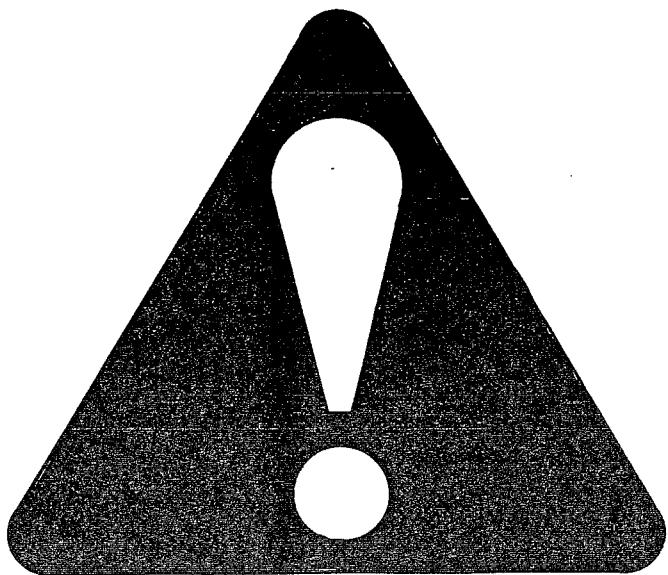

7. RESPONSIBILITY

PARMA COMPANY will not be responsible for defects in parts or equipment not manufactured by it, beyond the guarantee of the outside manufacturer or such parts.

DANGER

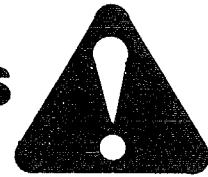

1. KEEP ALL SHIELDS, HOODS AND COVERS IN PLACE.
2. DISCONNECT POWER SOURCE TO ADJUST OR SERVICE.
3. MAKE CERTAIN EVERYONE IS CLEAR OF EQUIPMENT BEFORE APPLYING POWER.
4. DISCONNECT POWER BEFORE RESETTING MOTOR OVERLOAD.
5. KEEP HANDS, FEET, AND CLOTHING AWAY FROM POWER DRIVEN PARTS IN MOTION.
6. KEEP ALL PIT OPENINGS COVERED WHEN NOT IN USE.
7. **WARNING!** BEWARE OF MANURE GAS IN PIT. DO NOT ENTER. GAS CAN BE **FATAL**.

CAUTION

Liquid Manure Produces DANGEROUS GASES

1. Do not attempt to agitate liquid manure unless the ventilation system is in full operation and/or windows and doors are all open. Gases are more apt to be disseminated during the agitation than during the pumping period.
2. Do not enter a liquid manure tank of any type unless you have a special breathing apparatus. In addition, a rope should be tied around the waist and held by a person outside the danger area so that if the person is overcome by the poisonous gases or from the lack of oxygen, he may be pulled to safety without his rescuers also being overcome.
3. If an operator does feel faint, get him out into the fresh air and give him artificial respiration if required.
4. Use portable fans to expel gases and replace them with fresh air.
5. Reduce possible danger to livestock by using a two-fan system of ventilation. The small fan should operate continuously while the large one is controlled by a thermostat.

CONCLUSION:

We recommend that all operators of liquid manure equipment familiarize themselves with gas problems.

SELECTING YOUR PARMA PUMP

There are two basic types of PARMA PUMPS suited for a wide variety of applications. All pumps are available with electric or PTO drive.

Parma Multi-Service (M-S) Pump

MODELS: 11, 12, 13, 14, 15, 16 & 18

HEADS: to 50 feet

CAPACITY: to 4,500 GPM

-Low lift irrigation

-Manure transfer and agitation, particularly hog manure

-General pumping of materials with moderate sized solids

Parma Chopper Pumps

MODELS: 33, 34, & 35

HEADS: to 50 feet

CAPACITY: to 1,200 GPM

-Pumping of stringy, fibrous materials

-Particularly suited for dairy, beef and poultry manure

-Pumping of processing plant wastes

The following pages provide the method used to select and order the PARMA PUMP best suited for the requirements.

For each type of pump, a typical example is developed and solved to better show the selection process. A proper order entry is also included with each example.

Part I

SELECTION OF PUMP FOR TYPICAL LOW LIFT IRRIGATION SYSTEMS

Pages 1-5 and 1-6.

Part II

SELECTION OF PUMP FOR MANURE HANDLING

Pages 1-6 and 1-7.

Part I

Selection of pumps for typical lift irrigation systems

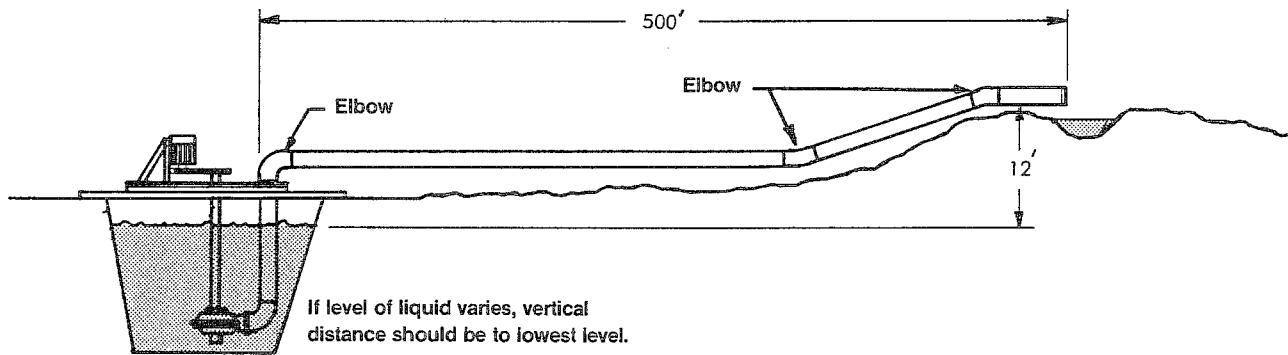

The selection of a pump for low lift flood irrigation or general liquid transfer is best accomplished by first determining the volume of liquid to be moved in gallons per minute.

The next step is to determine the amount of vertical lift that the liquid will be moved. If the liquid will be pumped through pipe for any distance, the friction loss through the pipe and pipe fittings should be calculated and added to the lift to give the total dynamic head (TDH).

Next, study the various performance curves found in "Performance Curves" section. Select the PARMA pump which requires the lowest horsepower. Record the pump model number, RPM, and horsepower required. A reference chart on page 2-3 may also be used to select the required pump.

Next, determine if electric or PTO drive is needed and select the components required.

PUMP NEEDED TO PROVIDE 700 GPM OF WATER FROM A CANAL TO A FIELD 500 FEET AWAY. The installation may look like:

Find:

- A. Size of Piping Recommended
- B. TDH at Pump
- C. Model, Speed, and HP of PARMA Pump Best Suited
- D. Proper Order Entry

Solution:

A. Determine size of pipe from tables (steel page 2-1, plastic page 2-2) noting that liquid velocity should not be over 5 ft./sec. The correct size for steel pipe for 700 GPM would be 8" diameter.

B. TDH (total dynamic head) at pump = vertical lift + friction loss.
VERTICAL LIFT from example = 12 feet.

FRICITION LOSS for steel pipe are shown on page 2-1. Friction loss for plastic pipe are shown on page 2-2. Friction loss for fittings are approximately the same for steel or plastic and such losses are shown on page 2-1. Assume for this example that steel pipe is used. THEREFORE:

1. Determine friction loss in fittings (from table on page 2-1). Three 8" elbows at 20.2 equivalent feet of pipe each = 60.6 equivalent feet. This amount must be added to the 500 ft. of pipe making a total of 560.6 feet.
1. Total friction loss in the system (from table on page 2-1) = 560.6×1.54 divided by 100 = 8.6 feet TDH (total dynamic head) = 12 ft + 8.6 ft. = 20.6 ft.

C. Find pump model, speed, HP using the performance curves in section 2 for 21 ft. and 700 GPM.

MODEL	SPEED	HP
13	1180 rpm	11
14	800 rpm	9½
15	610 rpm	7½

In checking the Models 13, 14 and 15, it is readily seen that the Model 15 pump is best suited in that it requires the least horsepower. A 7½ HP motor would be used. (Lower RPM as well, will lengthen bearing life of the pump.)

For the electric drive a sheave/belt selection would then be necessary to produce 610 RPM pump speed. Find instructions for find the following required items on page 7-2.

- 1 - 2B6.4 QD sheave and SDS 1 3/8" bushing (for motor)
- 1 - 2B18.4 QD sheave and SK 2 1/4" bushing (for pump)
- 2- B85 V-belts

From pages 8-1 through 8-3 the following items would be required for electrical components assuming three phase power will be used.

- 1 - 7½ HP 3 Phase electric motor
- 1 - Size 1, 240 volt 3 phase magnetic starter

D. Assuming a setting length of 8' is required, the proper order entry would be: (refer to "Pump Ordering")

QTY	PART #	DESCRIPTION
1	815001	Model 15 M-S Pump Unit
1	804007-8	8' Pump Setting Assembly
1	805008-8	8' Discharge Assembly
1	801006	Mounting Frame Unit
1	892064	2B6.4 QD Sheave
1	980284	SDS 1 3/8 Bushing
1	892184	2B18.4 QD Sheave
1	980323	SK 2 1/4 Bushing
2	895085	B-85 V-Belts
1	890375	7½ HP 3 Phase Motor
1	890123	Size 1, 240 Volt 3 Phase Starter

Part II Selection of a pump for manure

NOTICE: Due to various types and consistencies of manure slurry, the horsepower and head capabilities referred to in this catalog are only approximate and are to be used as such.

In selecting pumps for the handling of liquid manure, special methods are needed to properly size the pump.

Gallons per minute is not directly the most important requirement of the pump. Typical manure pump installations utilize a pump placed in a pit (commonly called "reception pit") where the manure has been contained. The manure arrives in the pit by use of barn cleaners, scraping with a loader, or sometimes by gravity drain flush systems. Still other pits are directly filled by having a slotted floor with the pit underneath. In any case, the contents of the pit will need agitation to provide a pumpable and storable slurry. Therefore, in selecting the pump, adequate HP must

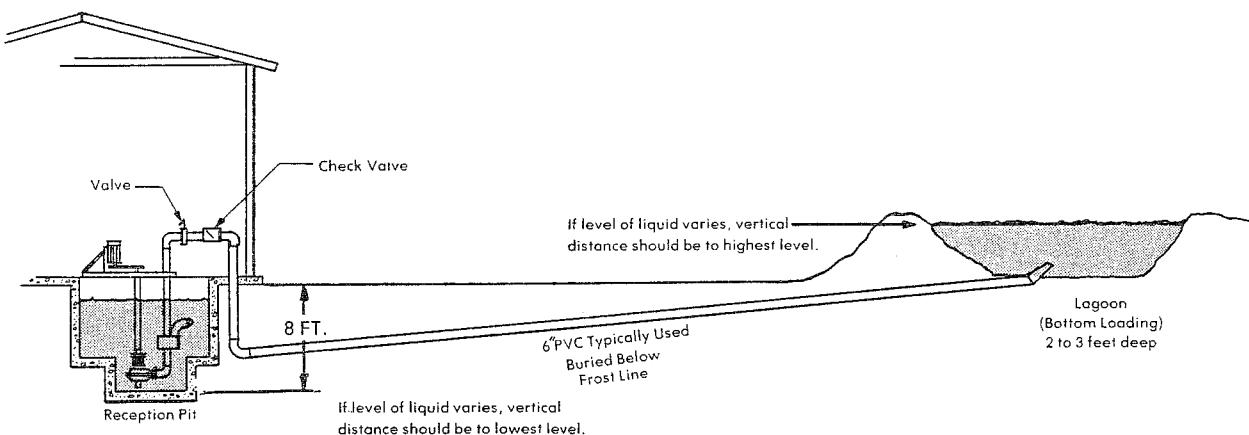

be provided to produce agitation. Generally, the following recommendations have proven to be useful: pits to 15,000 gallons - 15 HP and pits over 15,000 gallons - 25 HP. However, this general rule does not always apply. For instance, a reception pit of a very long length, narrow width, may fall under 15,000 gallons, but due to the distance the pump is from the far corners of the pit, a 25 HP pump would be a better choice.

Another problem to consider is the amount of electric horsepower allowed in many areas. In some cases the use of smaller than recommended pumps may be satisfactory with longer agitation periods. Another alternative is to use the PTO drive models to achieve the horsepower required.

Horsepower required during load out and agitation modes must also be considered. When the pump is re-circulating manure through the agitator, the effective head (or back pressure) against the pump is low and the horsepower demand is generally greater than during "loadout". Since head conditions during agitation are difficult to measure, approximate horsepower requirements during agitation are given for different pump speeds on page 2-15. For example the Model 34 Chopper Pump operating at 975 RPM requires 15 HP when agitating.

EXAMPLE:

Consider a dairy operation with 8' deep x 20' x 20' reception pit. Select a proper pump to agitate and load out manure to a nearby lagoon.

Find:

- Gallonage of pit and agitation horsepower.
- Pump Selection
- Order Entry

Solution:

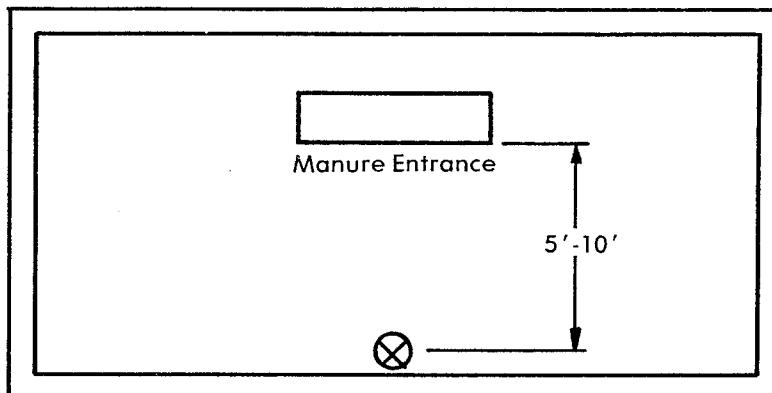

A. Gallonage of pit, $8 \times 20 \times 20 \times 7.4 \text{ gallons/ft}^3 = 23,680 \text{ gallons}$. Agitation HP required = approximately 25. (see first paragraph this page)

B. Pump selection from the previously stated guidelines indicates a 25 HP chopper pump would be most desirable. The Model 35 Chopper Pump, page 5-2, would be selected. From page 2-13, the maximum head to 840 RPM is approximately 39' which is acceptable for this example.

NOTE: If the above example were for swine manure, without any bedding, the Model #15 M-S Pump with an 8' setting and agitator would be a good choice. (Refer to "Pump Ordering - Steps 1, 2, 3, 4, 5, and 6.)

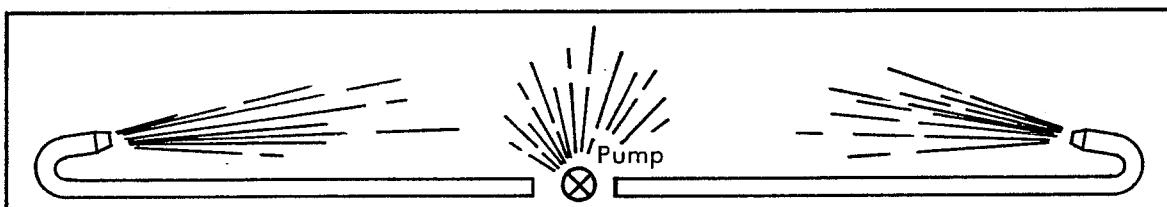

Some Tips on manure pump placement in pit:

- Position the pump as close to the center of the pit as possible, particularly in large pits.
- Use an 18 to 24 inch sump in the pit floor beneath the pump to allow complete clean out and increase the effective storage of the pit. (optional)
- On very long, narrow pits, place the pump in the center. Use remote agitation lines running to each end to provide circulation.
- Manure that is scraped or delivered to the pit by a barn cleaner should be deposited 5 to 10 feet from the pump.

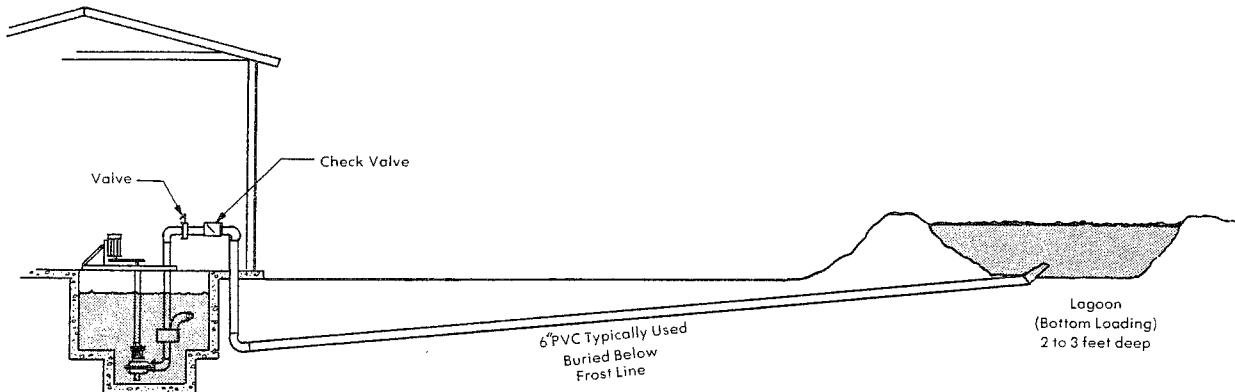

Recommended Pump Placement

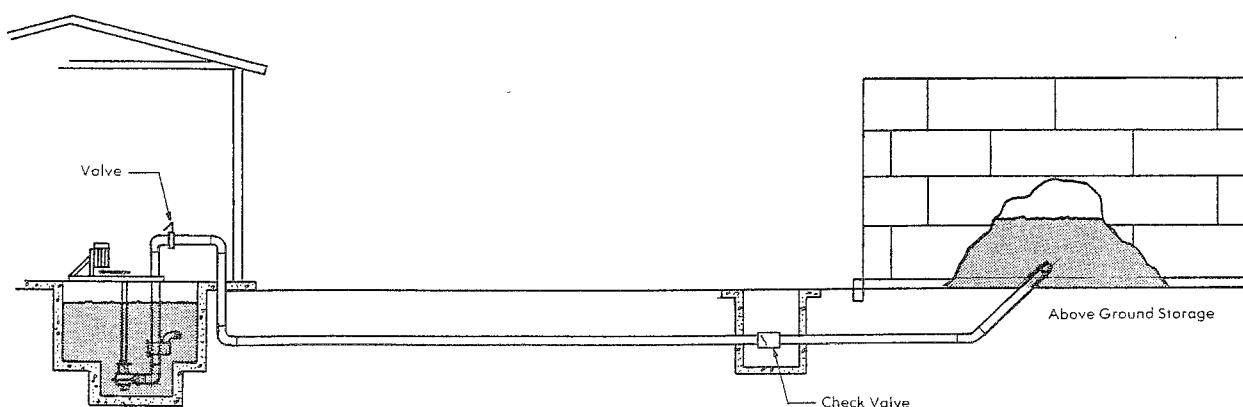

**Suggested installations in very long pits.
NOTE: Remote lines not provided.**

To find friction head loss in PVC or ABS pipe having a standard dimension ratio other than 21, the values in the table should be multiplied by the appropriate factor shown below.

SELECTION GUIDE
(see actual pump curves for final selection. page 2-4 ~2-13)

HORSEPOWER

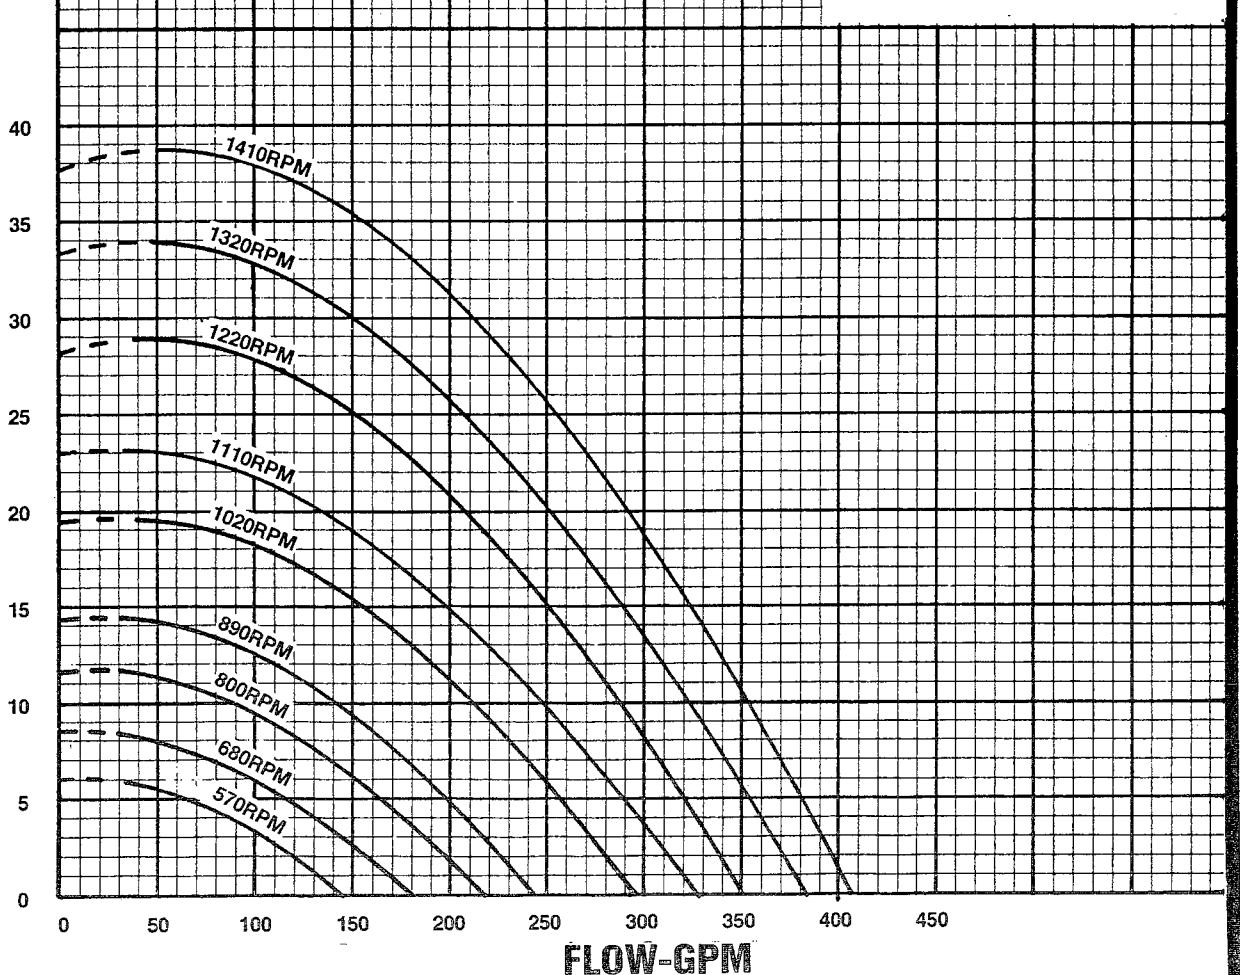

MODEL 11 PARMA MULTI-SERVICE PUMP PERFORMANCE CURVES

HYDRAULIC PERFORMANCE
WARRANTY (in water)

Guaranteed at designated point
only, and contingent on:
Proper flow to pump suction
Proper submergence
MAX. H.P. 7.5
MAX. SPEED 1410RPM

TOTAL HEAD FEET

--- Pump is not to operate continuously in this area.

**MODEL 12 PARMA
MULTI-SERVICE PUMP
PERFORMANCE
CURVES**

**HYDRAULIC PERFORMANCE
WARRANTY (in water)**

Guaranteed at designated point
only, and contingent on:

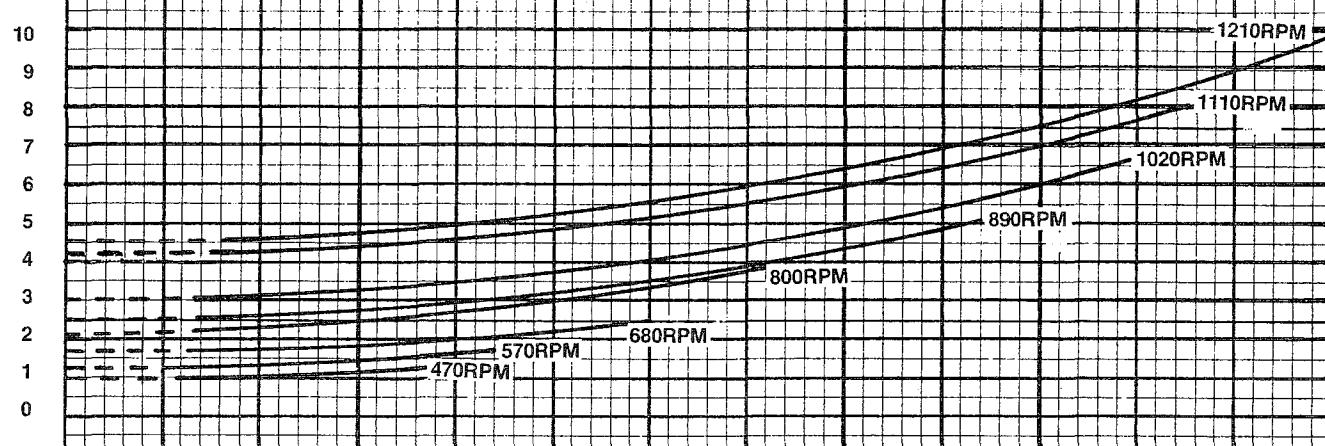

Proper flow to pump suction

Proper submergence

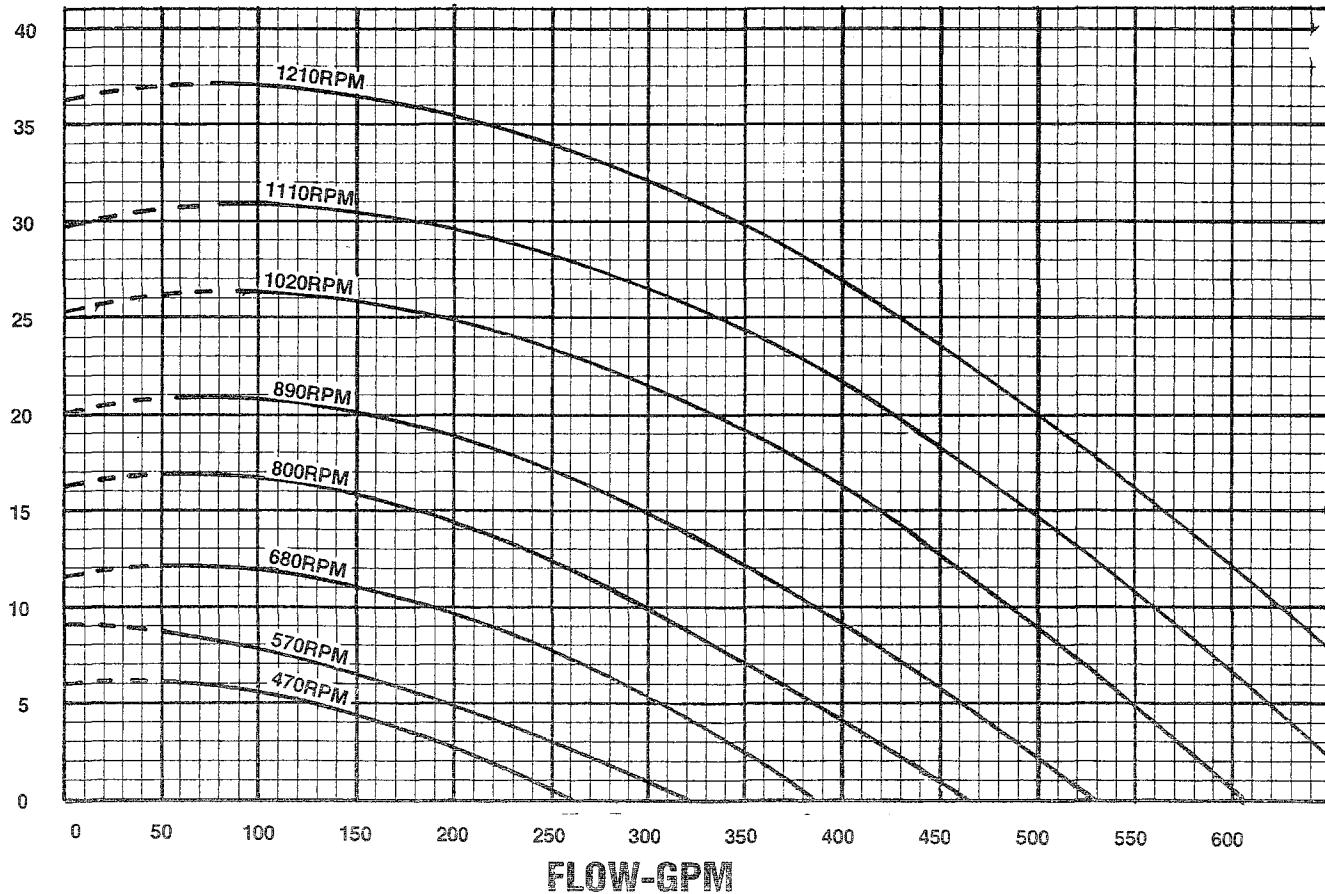

MAX. H.P. 10

MAX. SPEED 1210RPM

HORSEPOWER

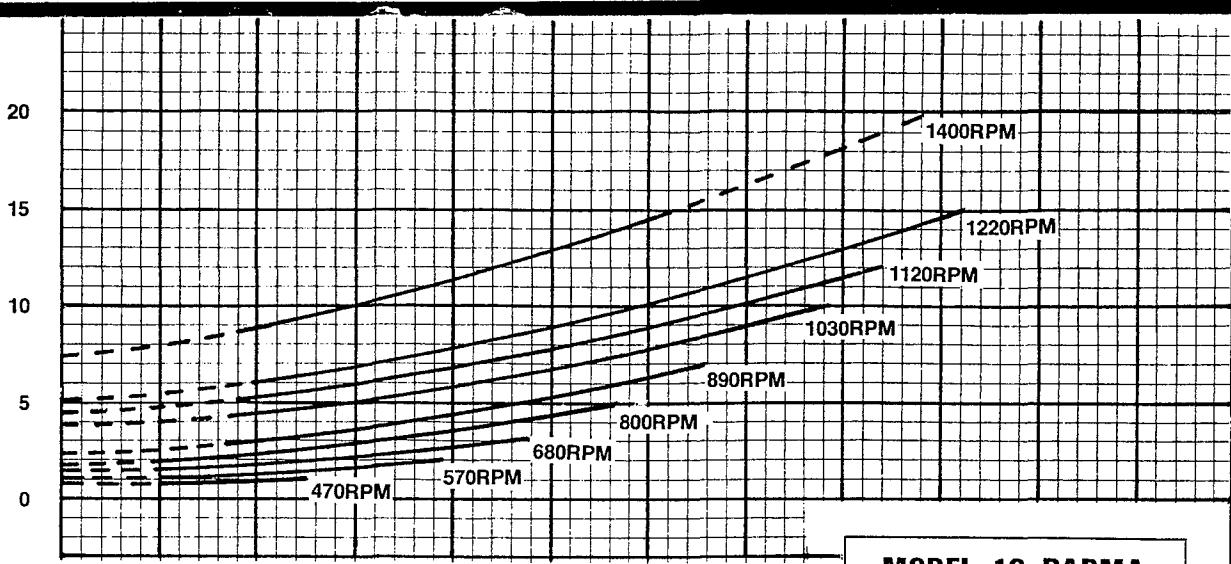

TOTAL HEAD FEET

-- Pump is not to operate continuously in this area.

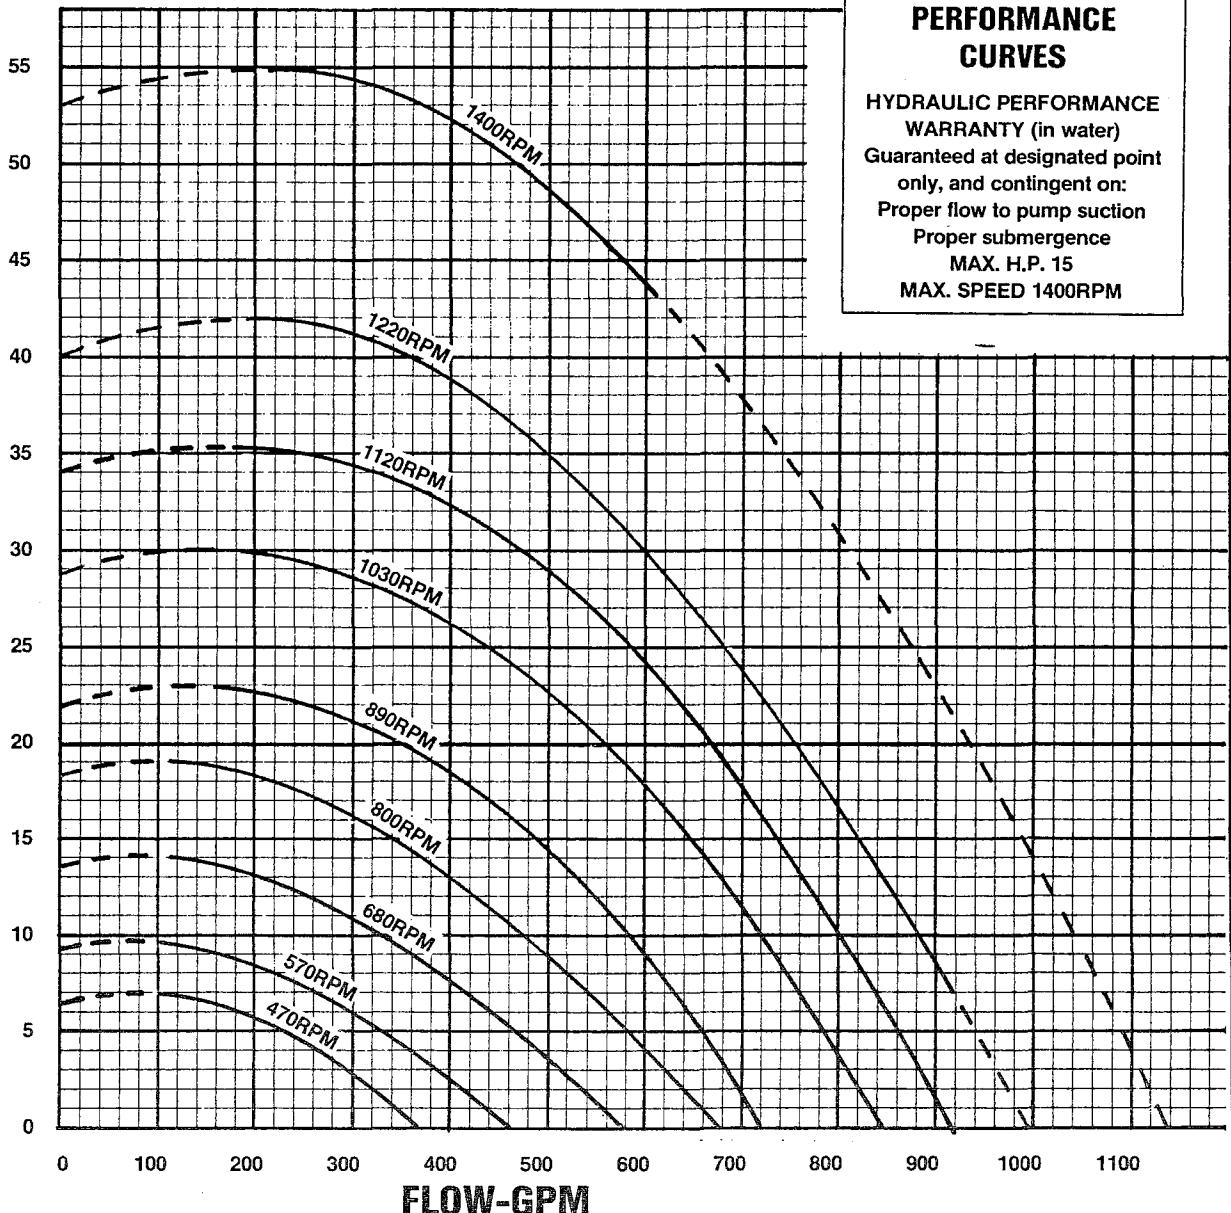

HORSEPOWER

**MODEL 13 PARMA
MULTI-SERVICE PUMP
PERFORMANCE
CURVES**

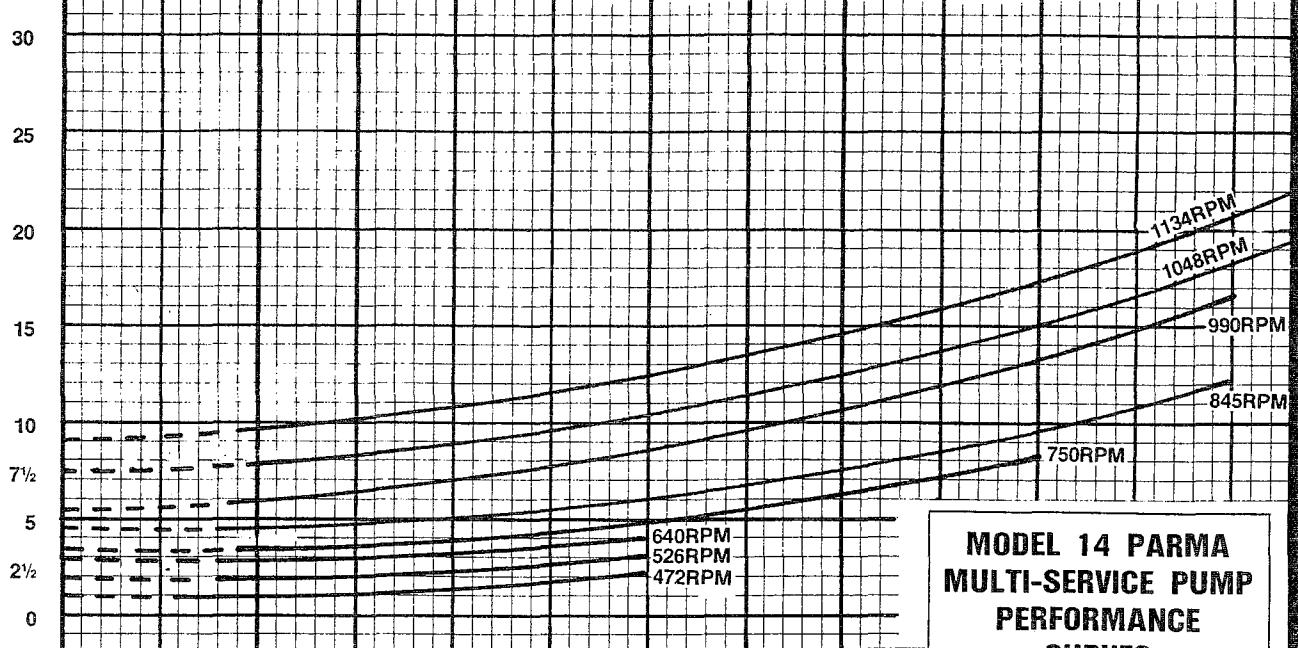

HYDRAULIC PERFORMANCE
WARRANTY (in water)
Guaranteed at designated point
only, and contingent on:
Proper flow to pump suction
Proper submergence
MAX. H.P. 15
MAX. SPEED 1400RPM

TOTAL HEAD FEET

--- Pump is not to operate continuously in this area.

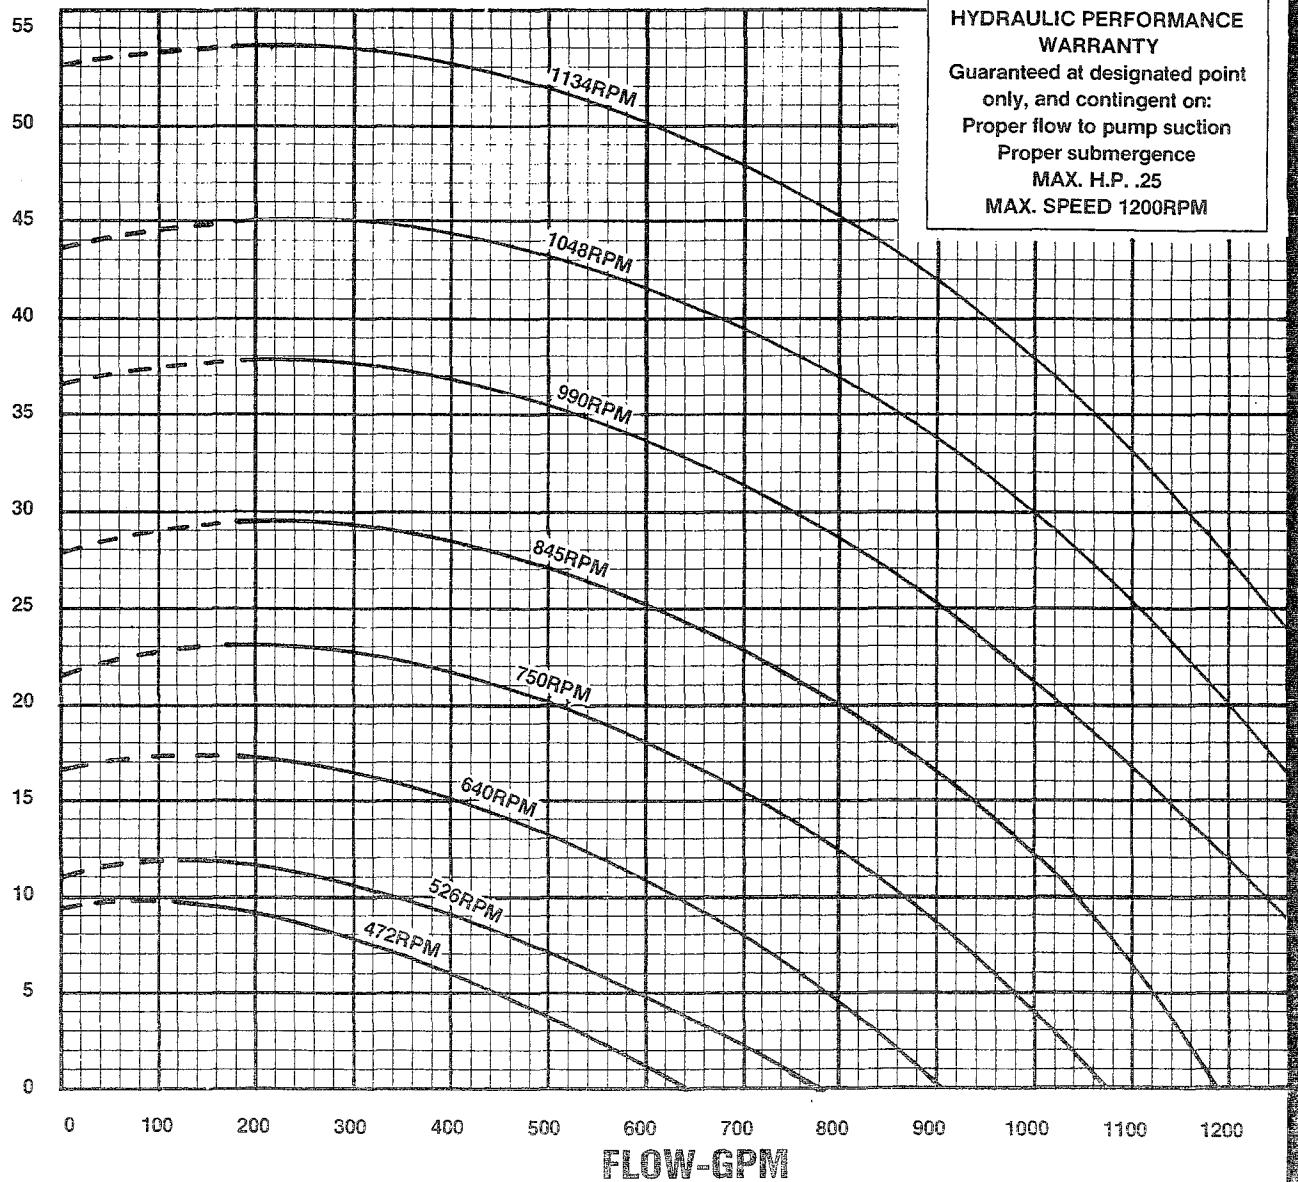

HORSEPOWER

MODEL 14 PARMA MULTI-SERVICE PUMP PERFORMANCE CURVES

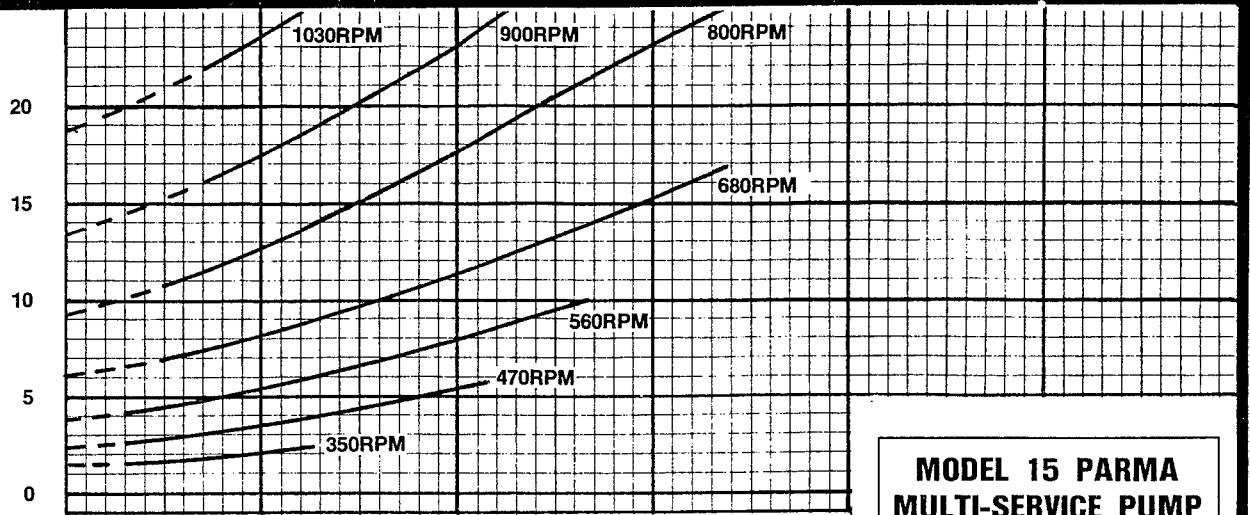

HYDRAULIC PERFORMANCE WARRANTY
Guaranteed at designated point only, and contingent on:
Proper flow to pump suction
Proper submergence
MAX. H.P. .25
MAX. SPEED 1200RPM

TOTAL HEAD FEET

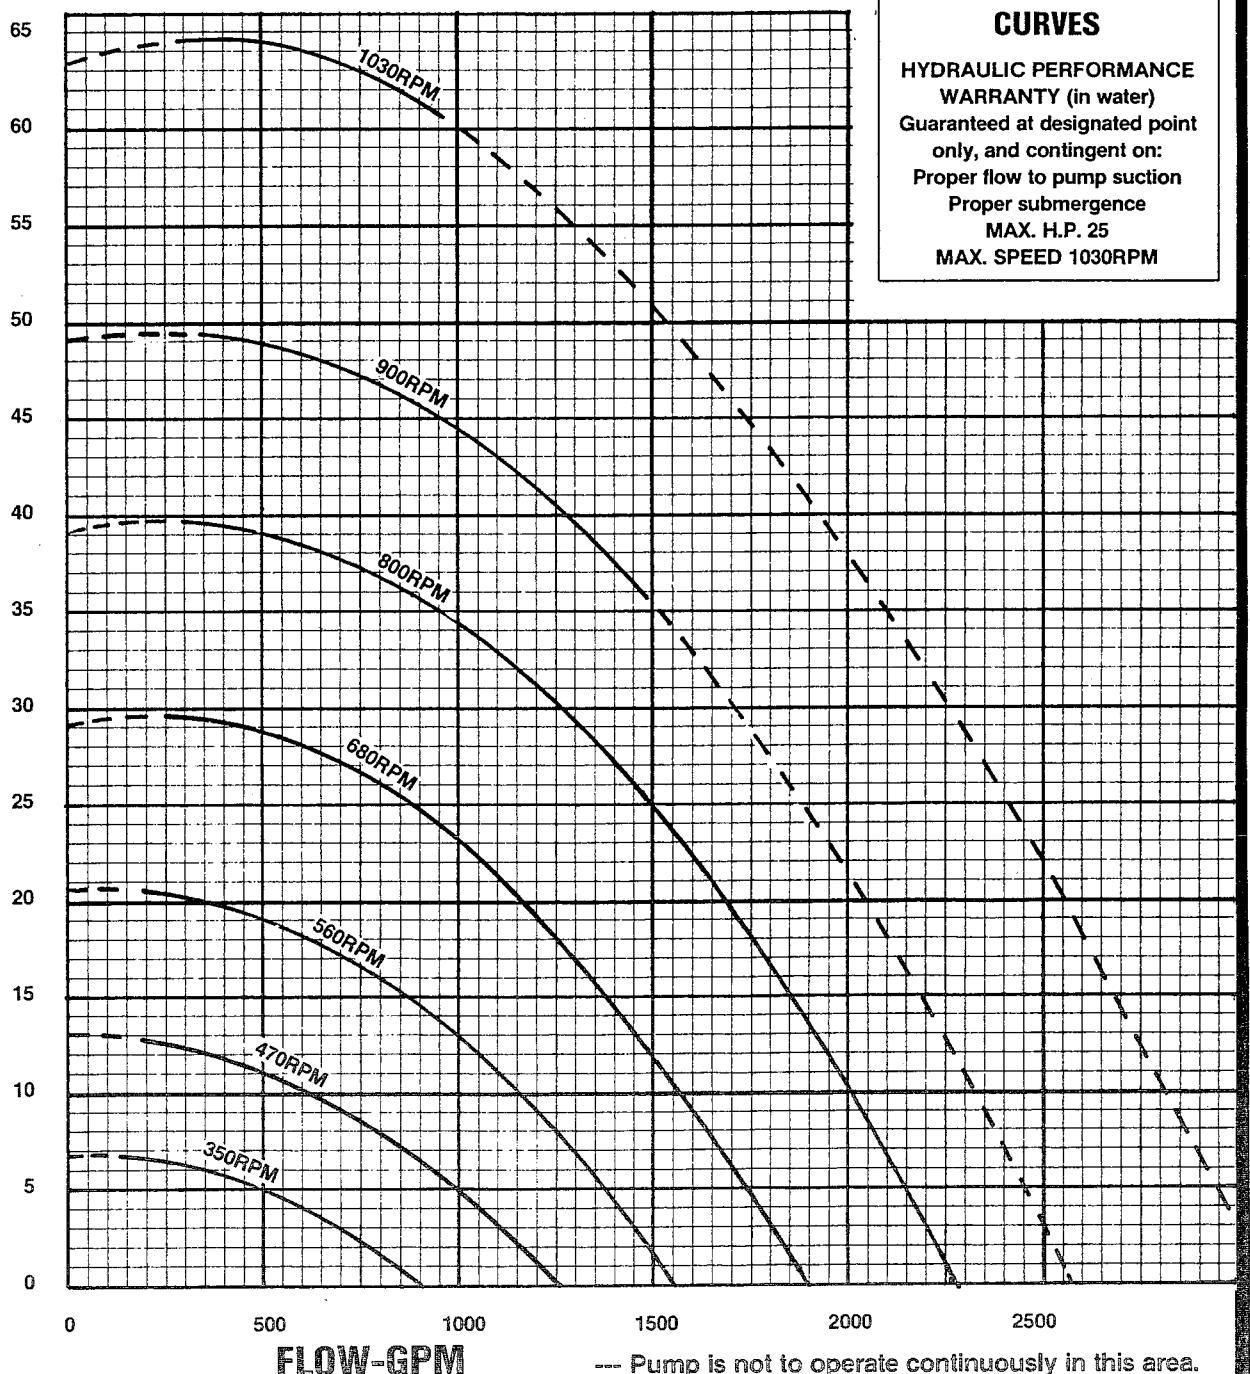

-- Pump is not to operate continuously in this area.

HORSEPOWER

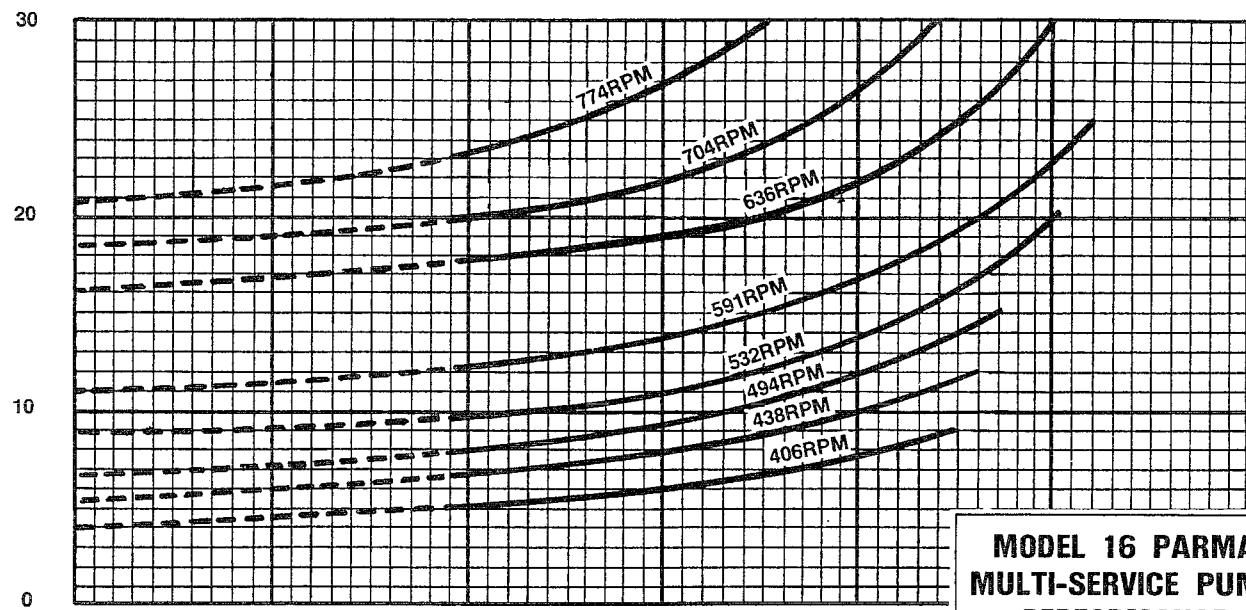

TOTAL HEAD FEET

**MODEL 15 PARMA
MULTI-SERVICE PUMP
PERFORMANCE
CURVES**

HYDRAULIC PERFORMANCE
WARRANTY (in water)
Guaranteed at designated point
only, and contingent on:
Proper flow to pump suction
Proper submergence
MAX. H.P. 25
MAX. SPEED 1030RPM

HORSEPOWER

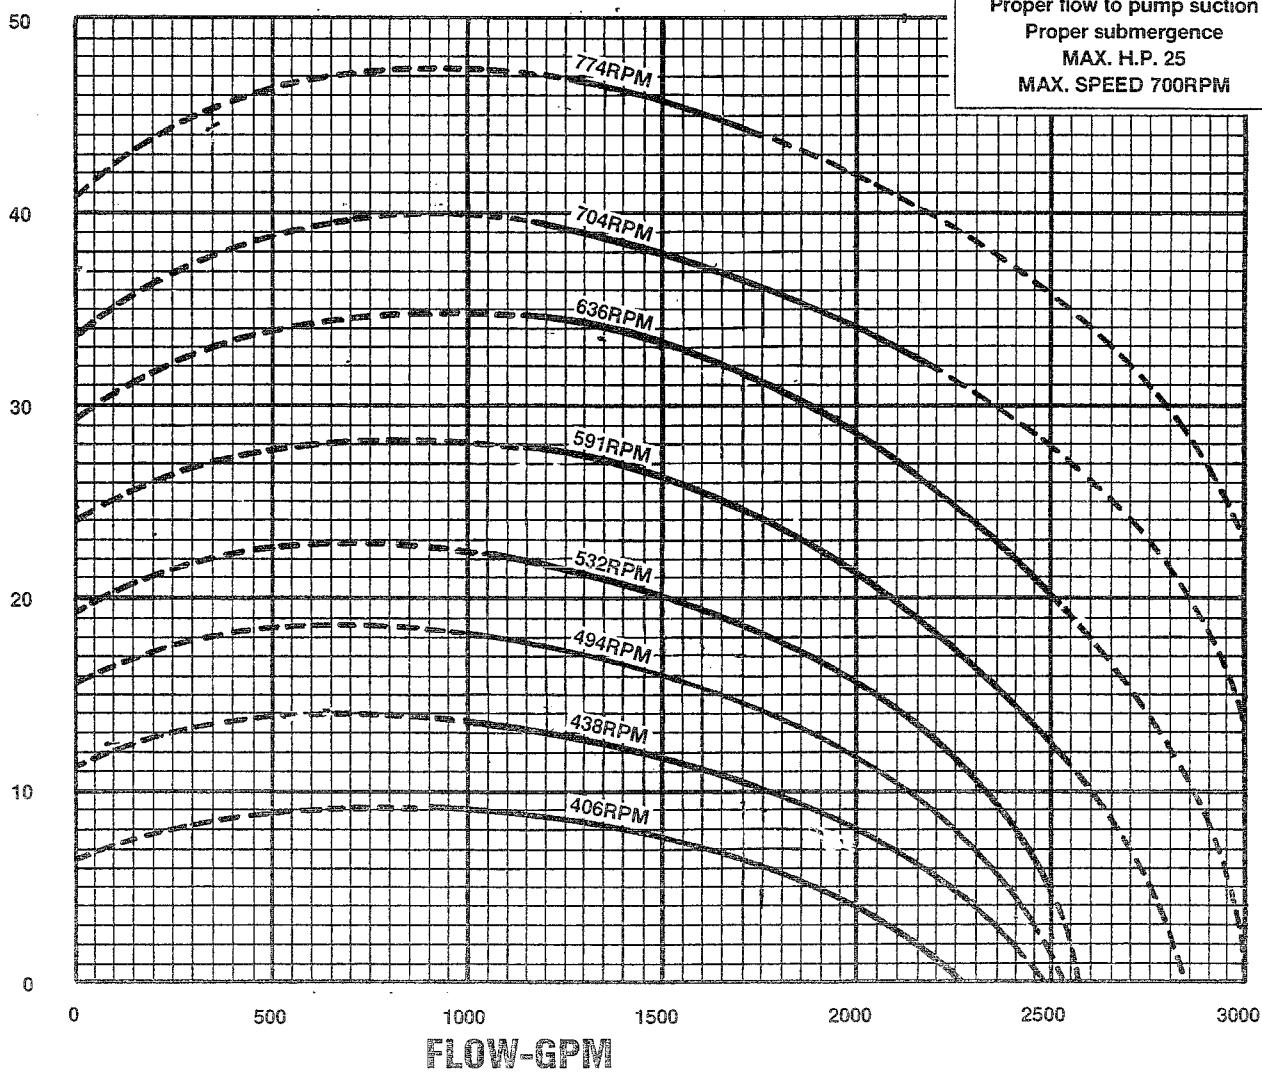

**MODEL 16 PARMA
MULTI-SERVICE PUMP
PERFORMANCE
CURVES**

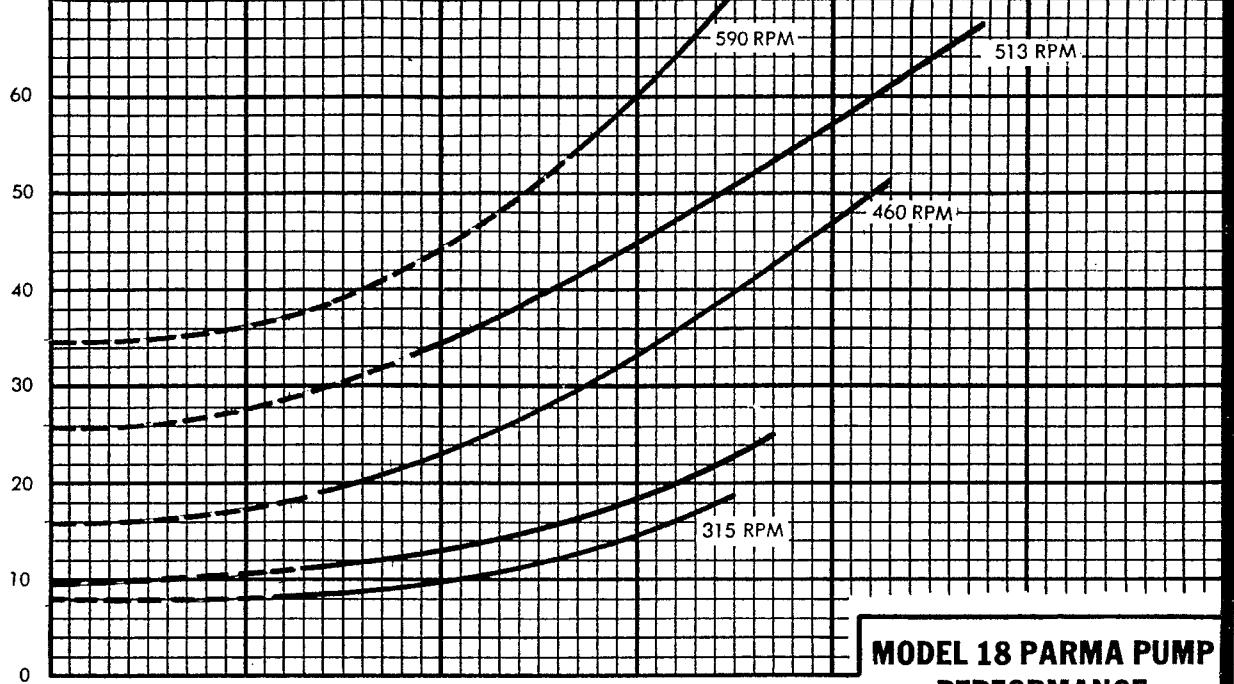

--- Pump is not to operate continuously in this area.

HYDRAULIC PERFORMANCE
WARRANTY (in water)
Guaranteed at designated point
only, and contingent on:
Proper flow to pump suction
Proper submergence
MAX. H.P. 25
MAX. SPEED 700RPM

TOTAL HEAD FEET

HORSEPOWER

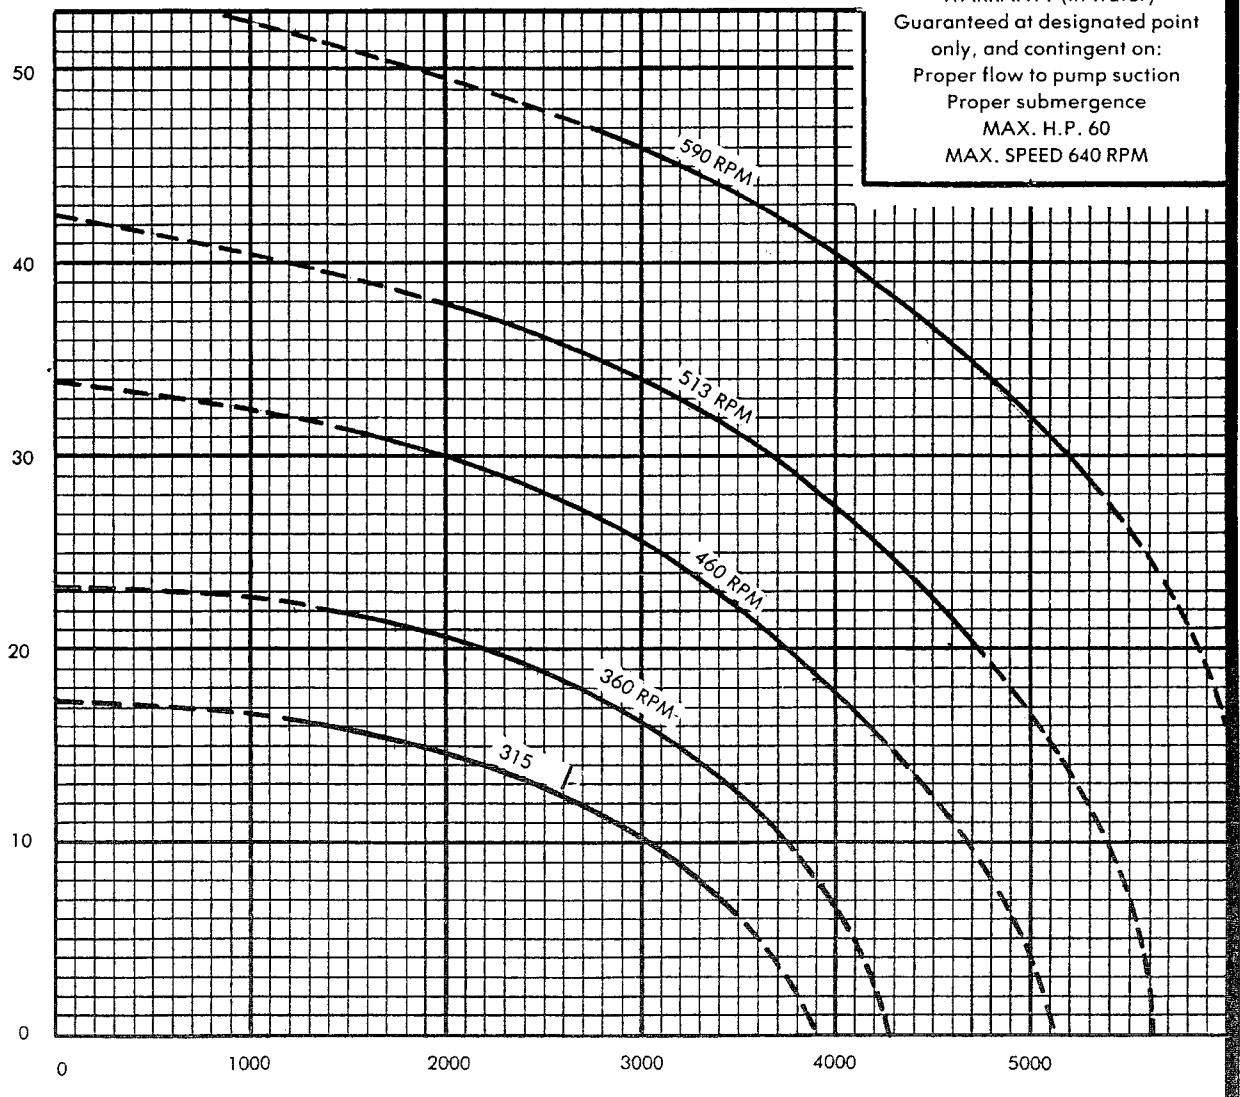

**MODEL 18 PARMA PUMP
PERFORMANCE
CURVES**

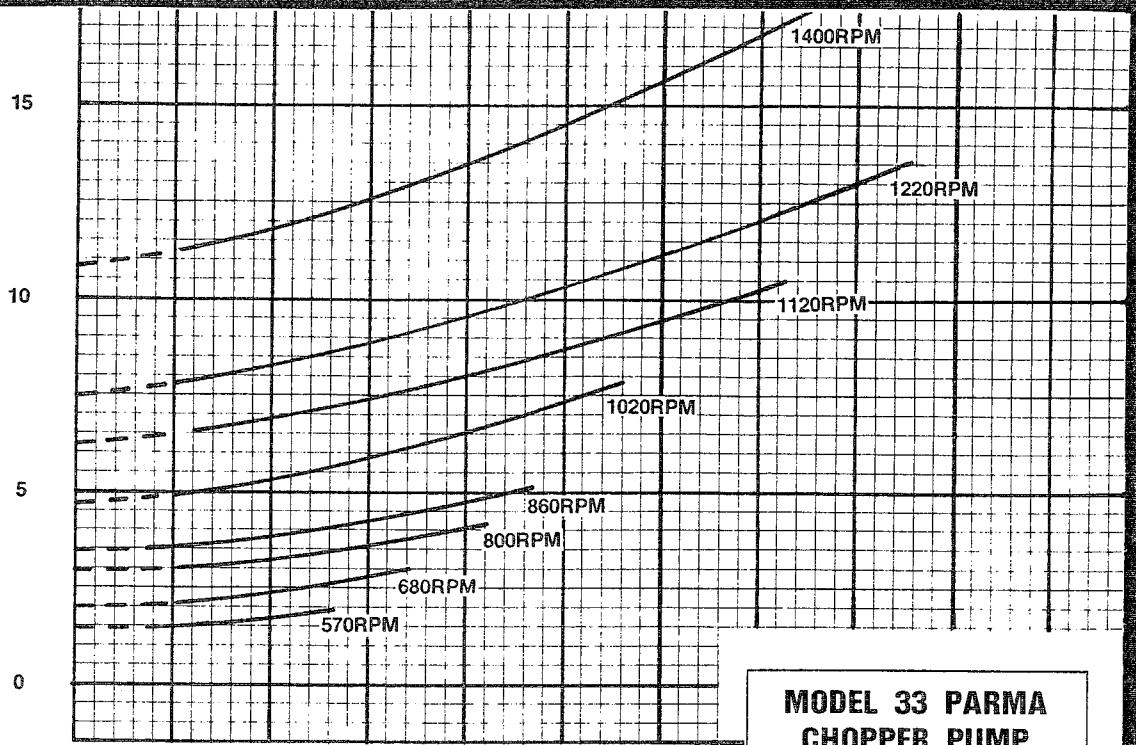

HYDRAULIC PERFORMANCE
WARRANTY (in water)

Guaranteed at designated point
only, and contingent on:
Proper flow to pump suction
Proper submergence
MAX. H.P. 60
MAX. SPEED 640 RPM

TOTAL HEAD FEET

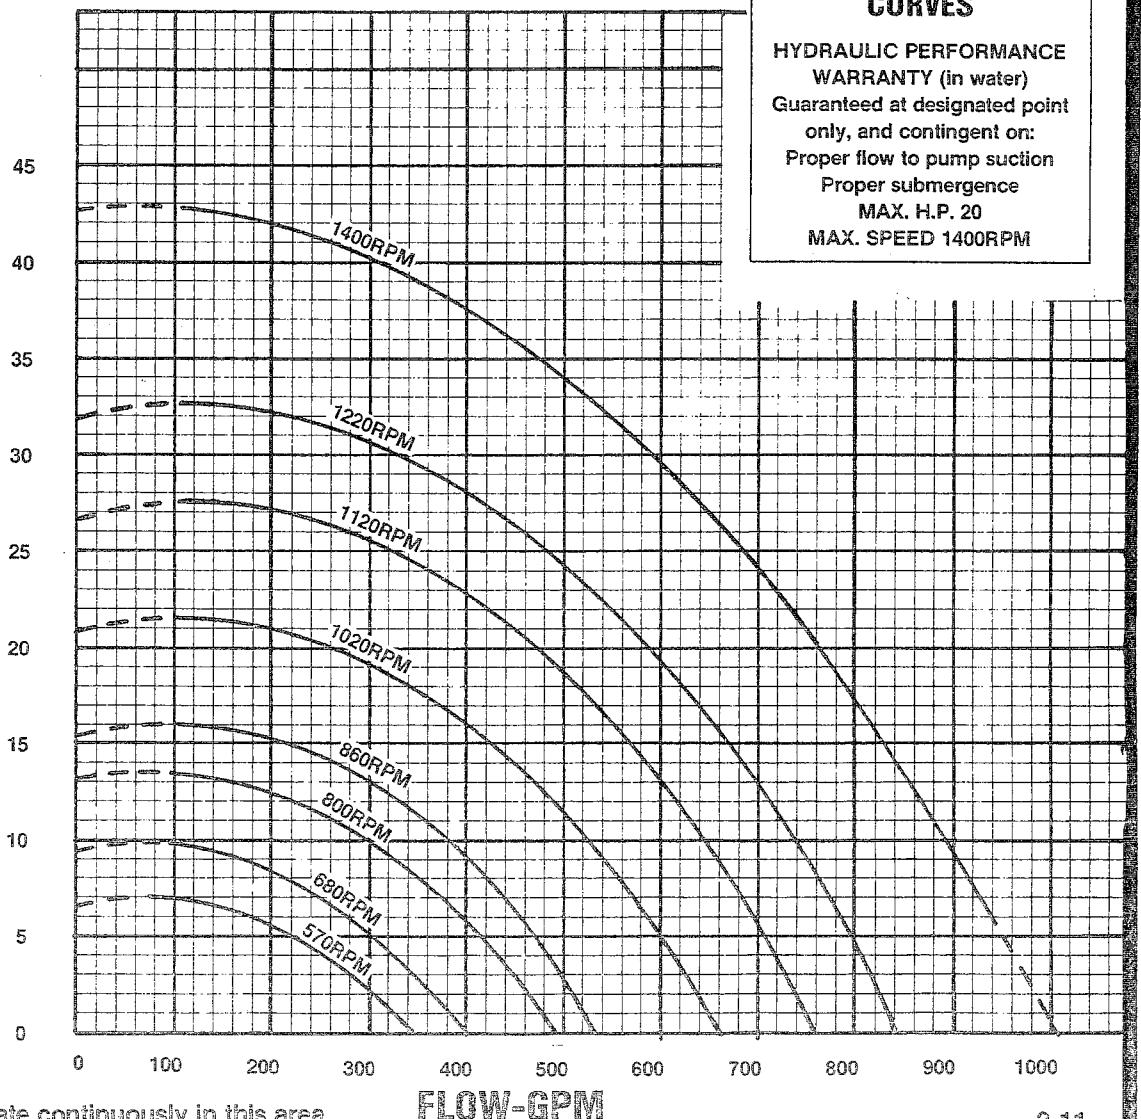

HORSEPOWER

**MODEL 33 PARMA
CHOPPER PUMP
PERFORMANCE
CURVES**

HYDRAULIC PERFORMANCE WARRANTY (in water)
Guaranteed at designated point only, and contingent on:
Proper flow to pump suction
Proper submergence
MAX. H.P. 20
MAX. SPEED 1400RPM

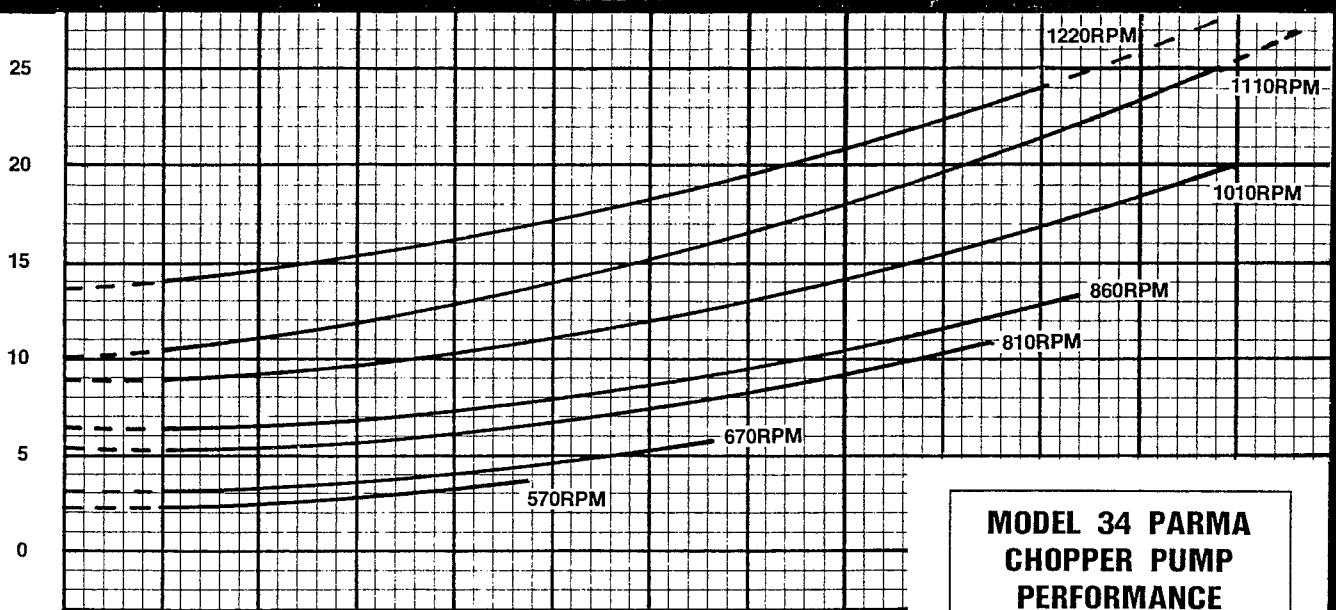

TOTAL HEAD FEET

-- Pump is not to operate continuously in this area.

FLOW-GPM

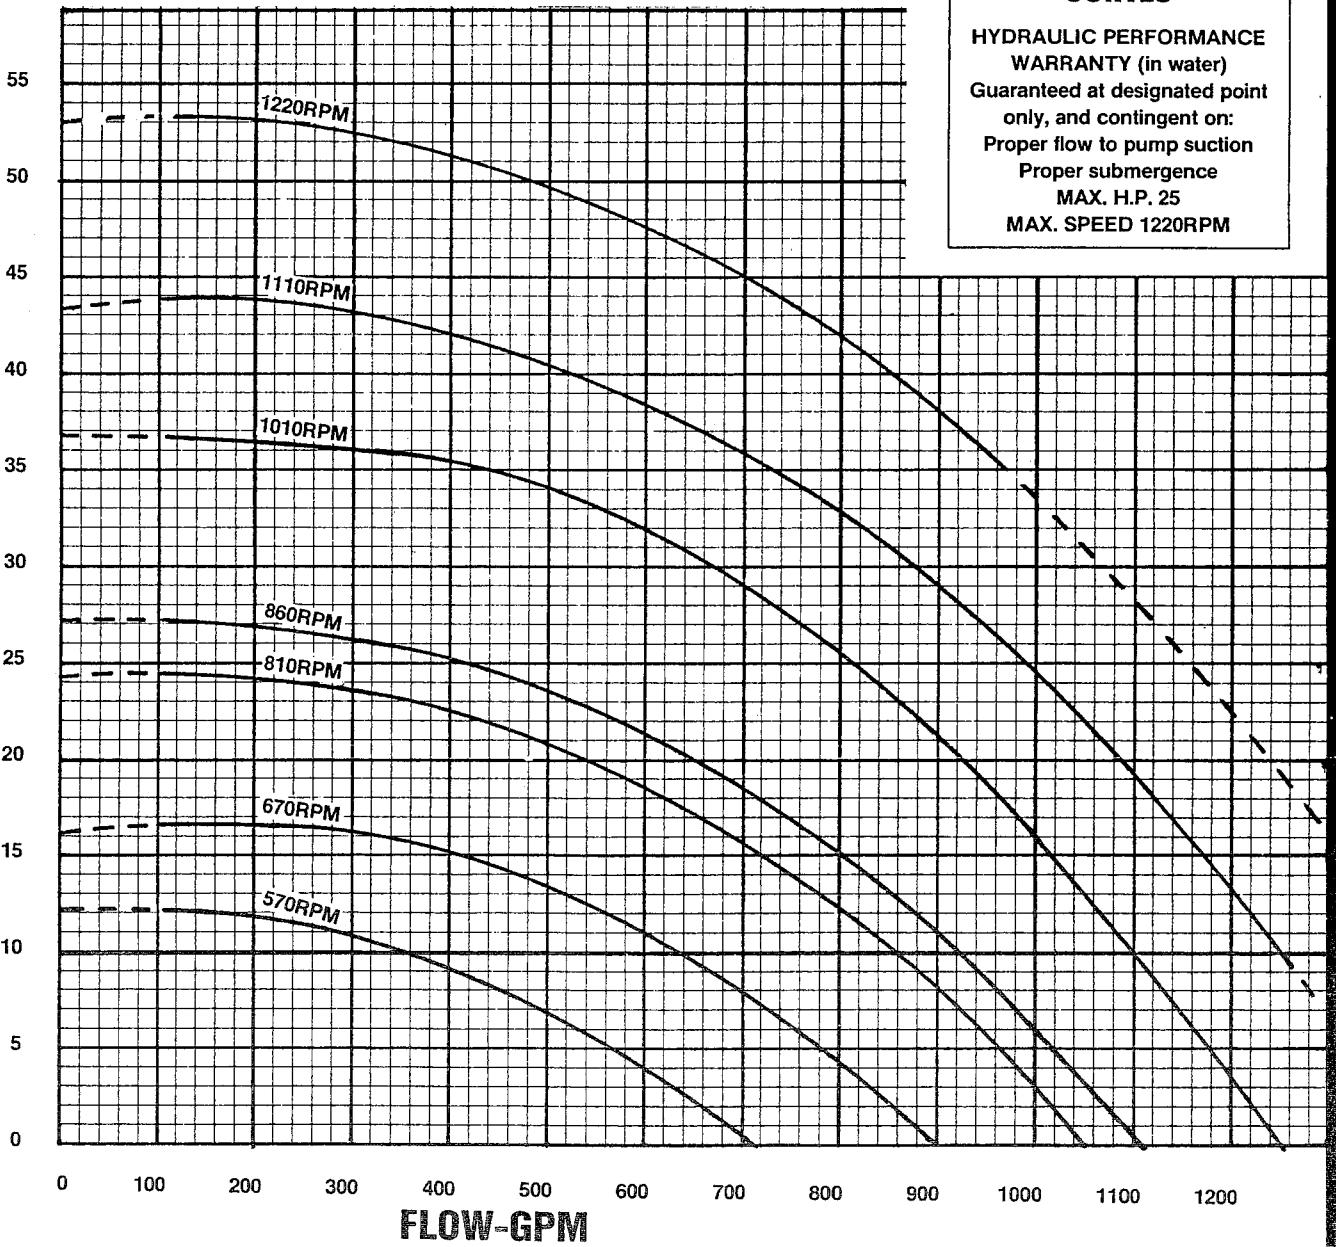

HORSEPOWER

MODEL 34 PARMA CHOPPER PUMP PERFORMANCE CURVES

HYDRAULIC PERFORMANCE WARRANTY (in water)
Guaranteed at designated point only, and contingent on:
Proper flow to pump suction
Proper submergence
MAX. H.P. 25
MAX. SPEED 1220RPM

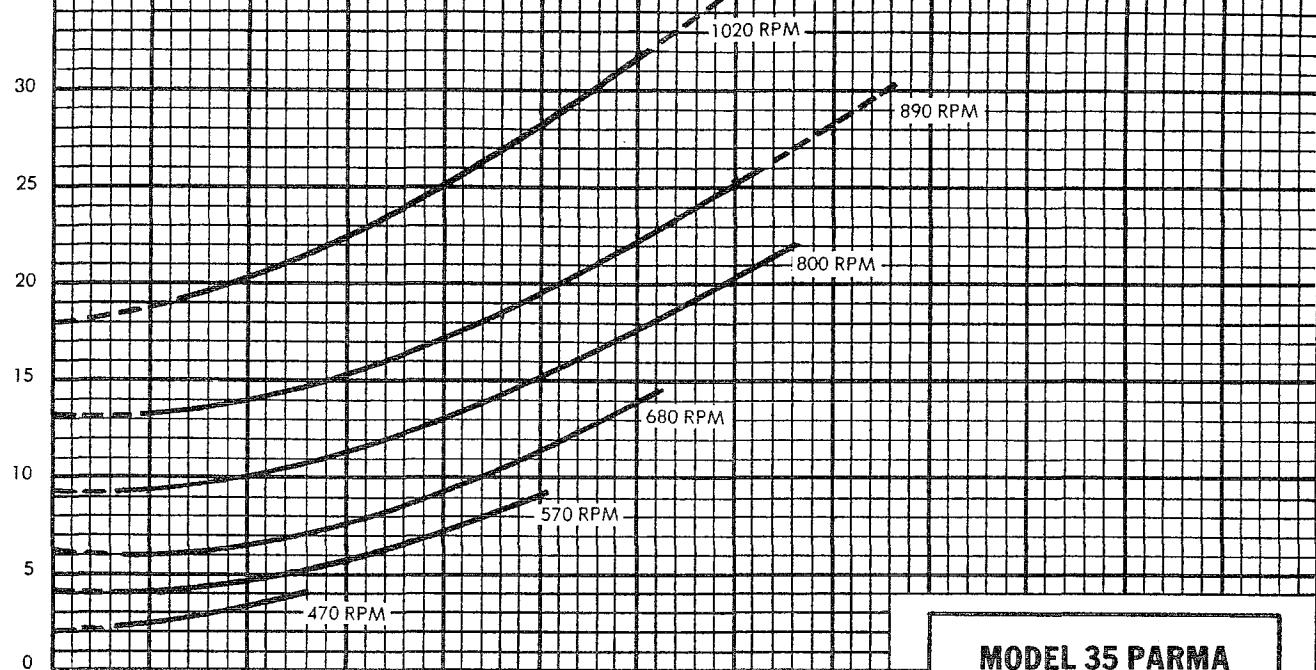

TOTAL HEAD FEET

FLOW-GPM

--- Pump is not to operate continuously in this area.

HORSEPOWER

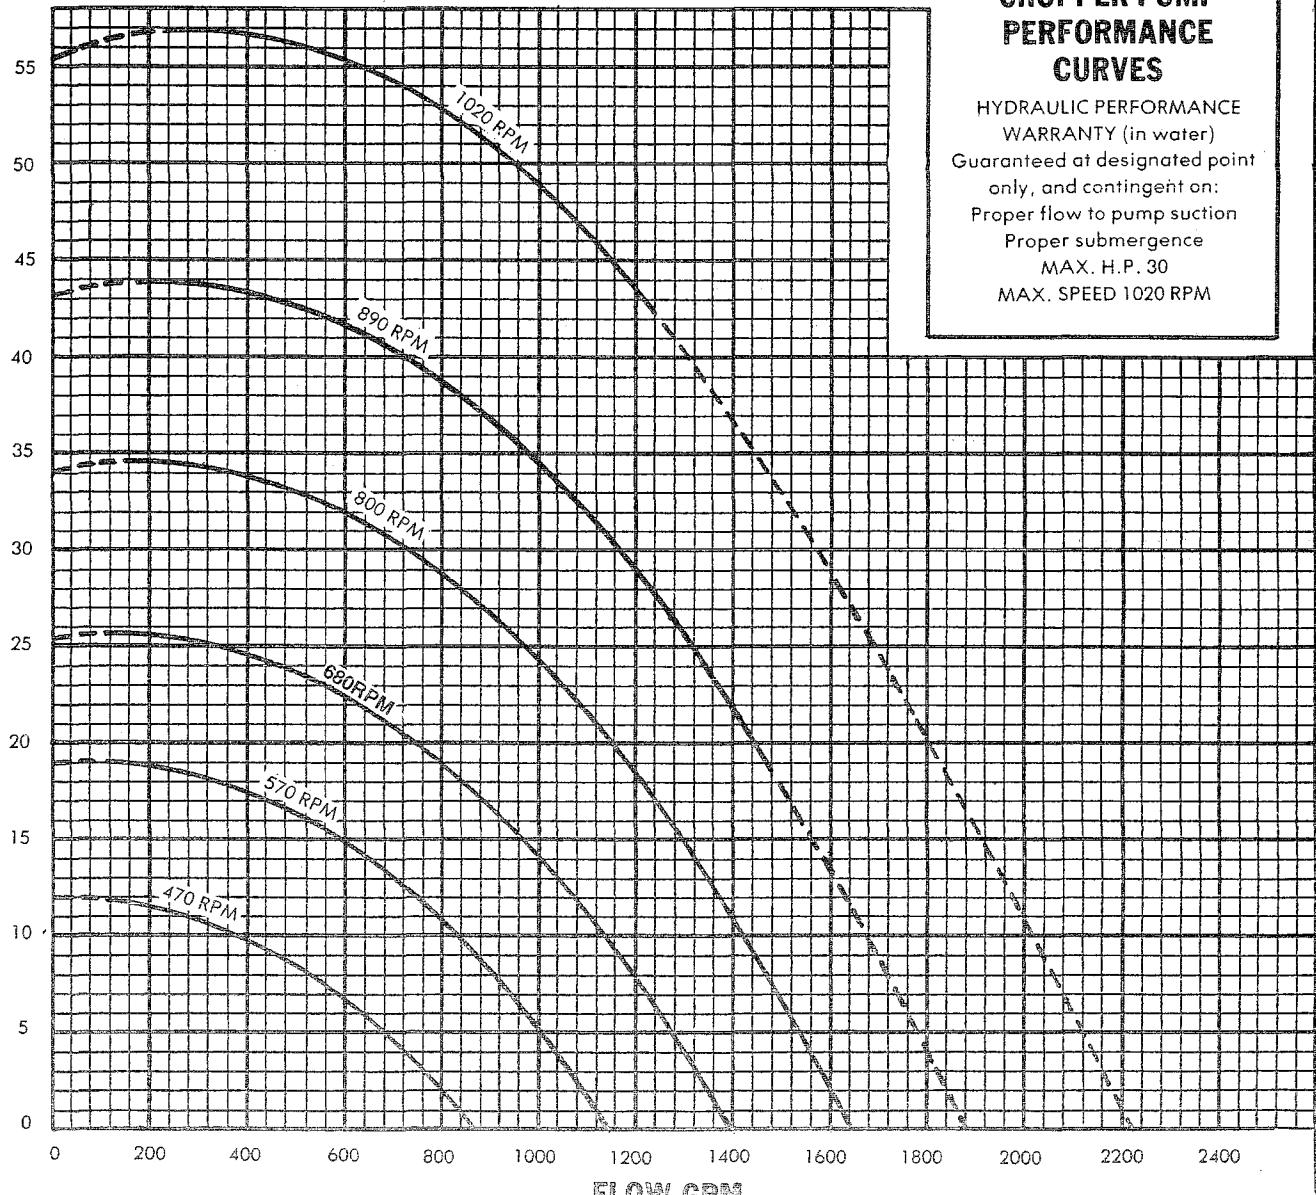

MODEL 35 PARMA CHOPPER PUMP PERFORMANCE CURVES

HYDRAULIC PERFORMANCE
WARRANTY (in water)

Guaranteed at designated point
only, and contingent on:
Proper flow to pump suction
Proper submergence
MAX. H.P. 30
MAX. SPEED 1020 RPM

TOTAL HEAD FEET

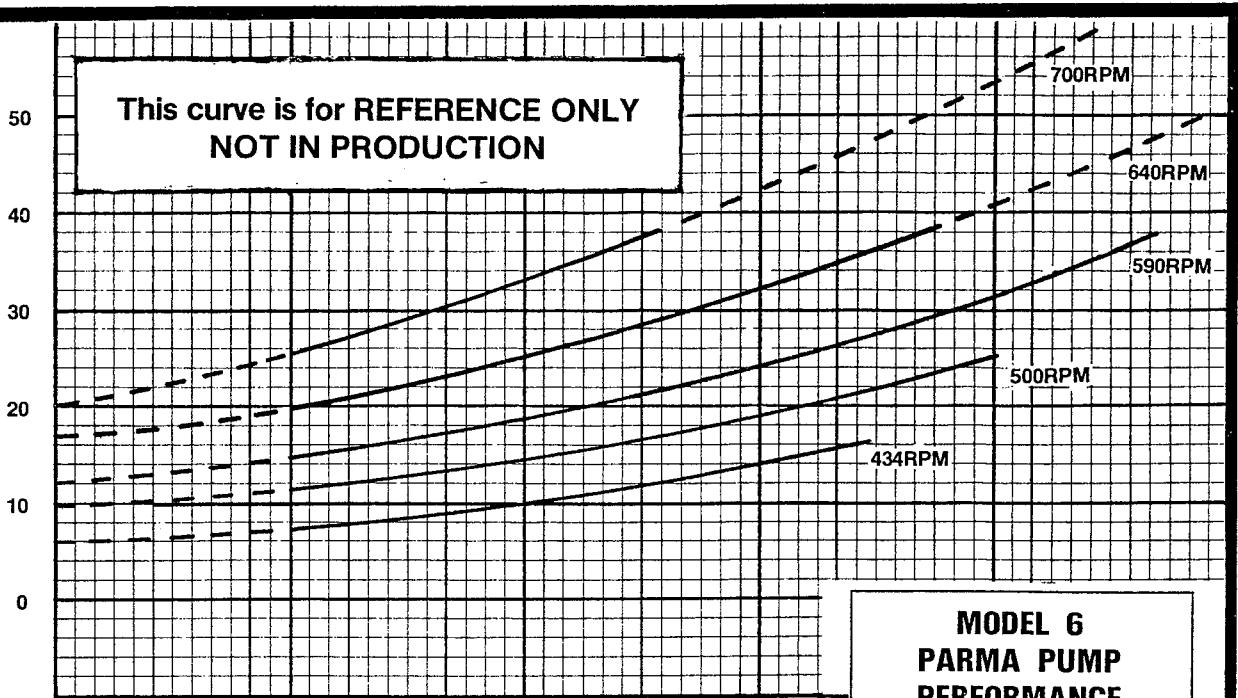

--- Pump is not to operate continuously in this area.

FLOW-GPM

— Pump is not to operate continuously in this area.
NOTICE: The Model 6 Parma Pump is no longer available after April 1, 1980.

HORSEPOWER

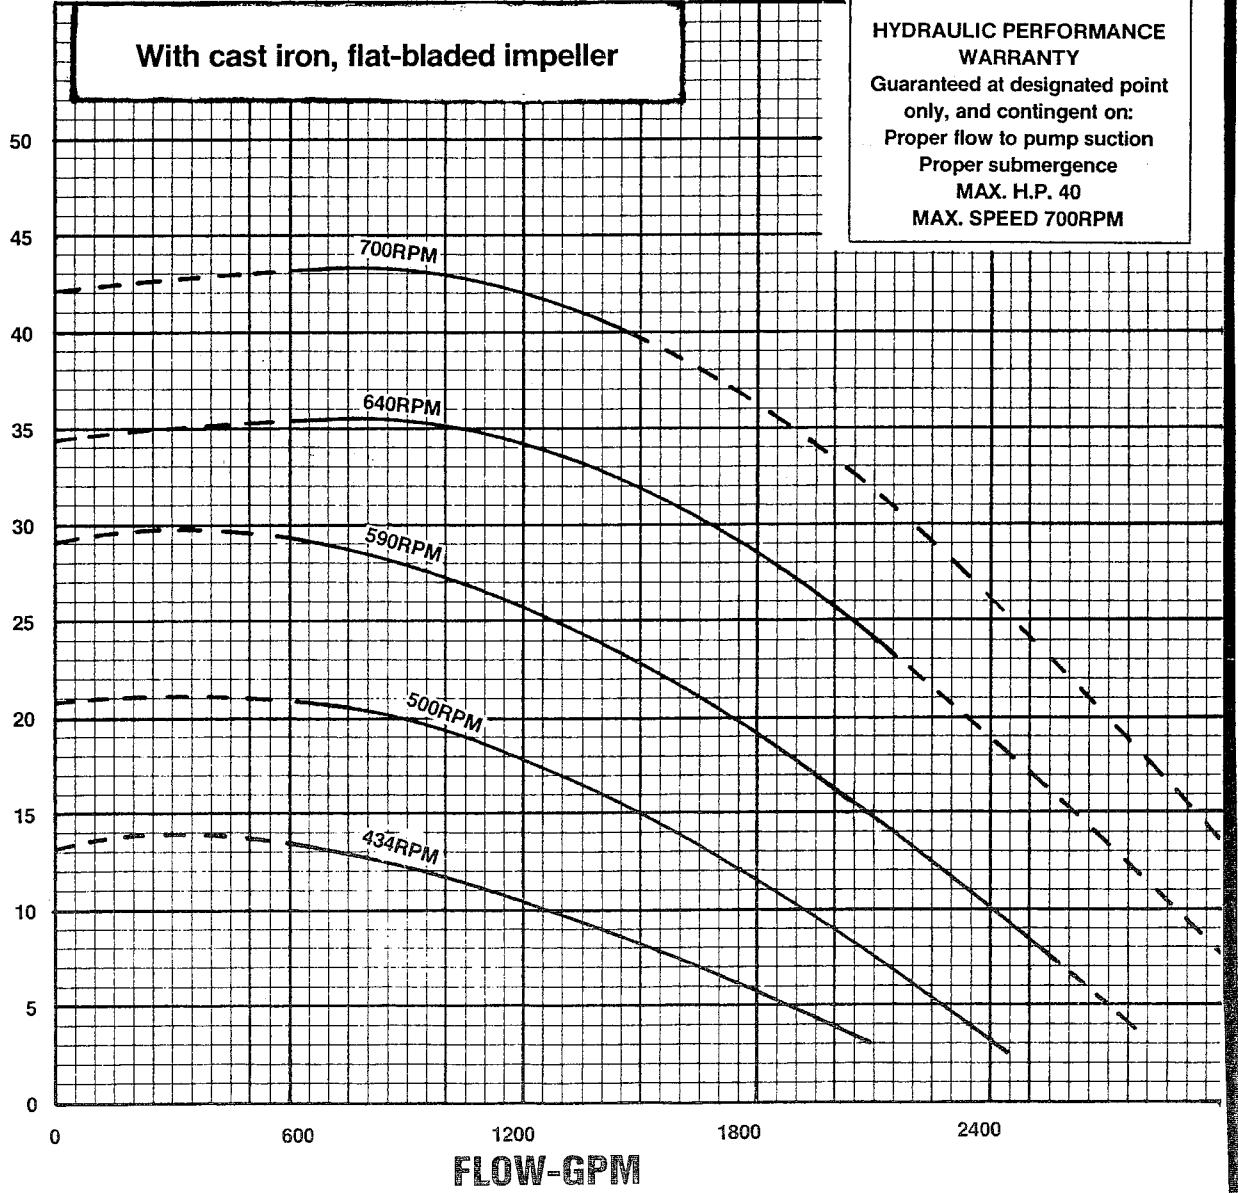

MODEL 6 PARMA PUMP PERFORMANCE CURVES

HYDRAULIC PERFORMANCE WARRANTY

Guaranteed at designated point
only, and contingent on:
Proper flow to pump suction
Proper submergence
MAX. H.P. 40
MAX. SPEED 700RPM

With cast iron, flat-bladed impeller

TOTAL HEAD FEET

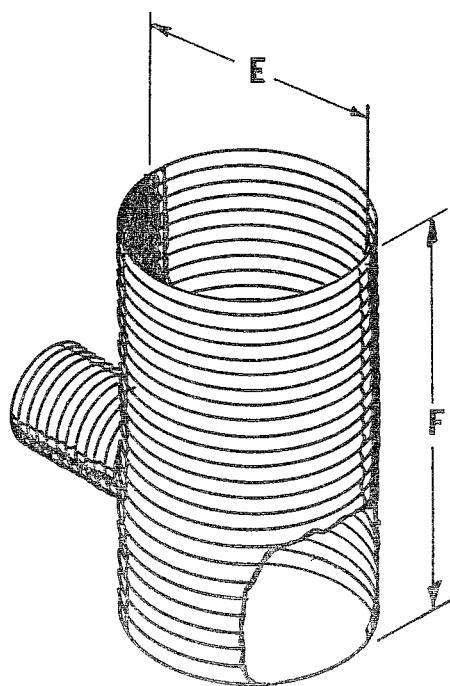

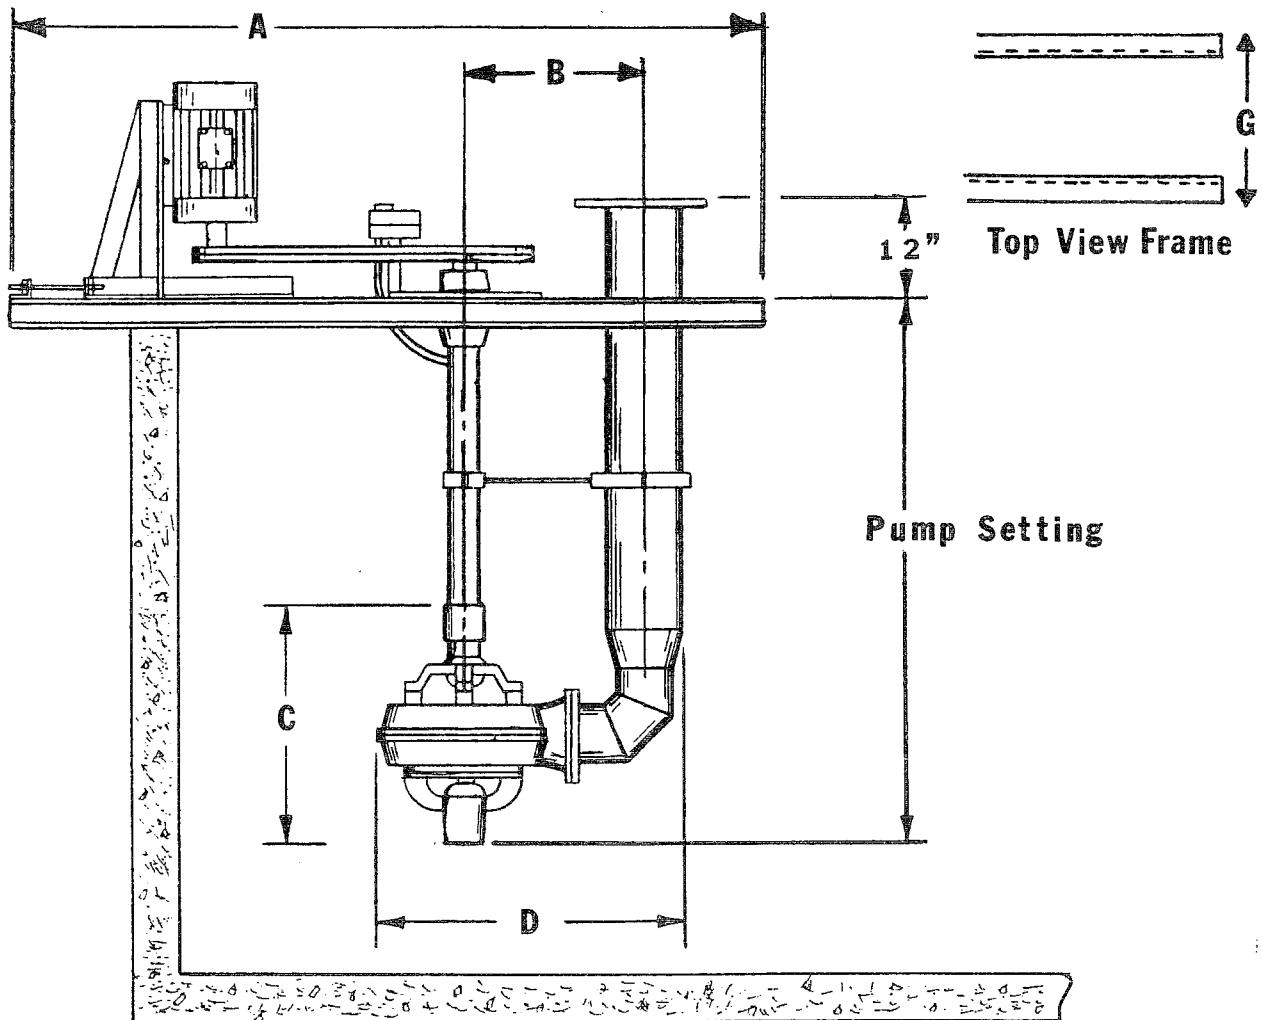

AGITATION HORSEPOWER

In the use of agitator assemblies with Parma Pumps, it is necessary to find the horsepower required during agitation once a pump speed (rpm) has been determined.

In most installations the pump will demand more horsepower during the agitation mode than during load-out. Once a pump model, speed, and motor are selected it is necessary to check the chart below to find the agitation horsepower. If the agitation horsepower shown is greater than that of the motor selected use a larger motor or slow the pump down to the speed required so that the motor will not overload.

MODEL	PUMP SPEED	AGITATION HP
34 Pump	1200 RPM	25
	1130 RPM	20
	1000 RPM	15
	875 RPM	10
35 Pump	975 RPM	30
	925 RPM	25
	890 RPM	20

BELT CENTER FOR PTO DRIVE SHOWN ON PAGE 7-5.

*For single phase 2 and 5 HP subtract 1".

NOTE: Instructions for use of charts on page 7-2.

INSTRUCTIONS FOR USE OF BELT, SHEAVE AND BUSHING CHARTS

1. Locate the speed in the pump RPM column, which is closest to the RPM previously determined for the pump.
2. Record the sheave pitch diameters shown in the second column.
3. Utilizing information provided on the chart on Page 7-1 indicating the belt length center to center, select an appropriate belt which will fall between the minimum and maximum lengths. The belt number is designated at the top of the column.
4. Follow the horizontal line over to the column indicating the rated HP per belt. Divide the HP rating into the HP required. The answer, rounded to the next highest number, is the number of grooves for the sheaves and the number of V-Belts required.
5. Locate the proper sheave diameter in the bushing chart in the column marked "Sheave Diameter".
6. Follow the chart horizontally to a point intersecting the number of grooves indicated at the top of the chart and record the letters indicated in the chart.
7. The bushing bore for the small sheave is the same as the shaft size of the motor and is shown in the electrical components section in the "Shaft Size" column adjacent to the HP rating of the motor.
8. The sheave bushing bore for the large sheave can be located in the chart on this page - "Pump Sheave Bore" next to the appropriate model number.
9. Record the appropriate bushing number and bore size.
10. The appropriate sheaves are located on page 7-6. The appropriate bushings are located on page 7-7. The appropriate belts are located on page 7-8.

EXAMPLE:

Desired pump RPM - 978. Utilizing mounting frame unit 802006 for 15 HP motor with Model #14:

1. Locate 978 RPM on page 7-3.
2. Sheave diameters are 8.6 and 15.4.
3. Belt length center to center, minimum is $22\frac{1}{2}$ " to maximum $28\frac{1}{2}$ ". There are two belts which fall between the minimum and maximum, those being a B-85 at 24.3" and B-90 at 26.8". Either belt would be satisfactory.
4. The rated HP per belt is 10.7 and the HP utilized is 15. Fifteen divided by 10.7 equals 1.4 which when rounded to the next highest number indicates the need for two belts and also indicates the requirement of two groove sheaves.
5. In the sheave diameter column in the bushing chart on page 7-4, the 8.6 diameter intersects the two groove column within the SK area.
6. The 15.4 sheave intersects the two groove column within the SK area.
7. The shaft size of a 15 HP motor is shown to be $1\frac{5}{8}$ " in the shaft size column on Page 8-1.
8. For a Model #14 pump, the sheave bushing bore shown in the chart below is $2\frac{1}{4}$ ".
9. One SK $1\frac{5}{8}$ " QD Bushing and one SK $2\frac{1}{4}$ " QD Bushing are required.

PUMP SHEAVE BORE	
Models 11, 12, 13	1"
Models 14, 15, 16, 33, 34, 35	$2\frac{1}{4}$ "
Model 18	$2\frac{3}{16}$ "

SHEAVES - QD BUSHINGS - V- BELTS

FOR USE ON TRACTOR PTO DRIVE ASSEMBLY

NOTE: PTO Belt Center to Center is $26\frac{1}{2}$ " Minimum - $34\frac{1}{2}$ " Maximum

DIRECTIONS FOR ORDERING

1. Determine required pump speed.
2. Determine tractor PTO speed.
3. Select components which best fit the ratio desired from one of the following groups.

GROUP A - SHEAVE RATIO 1 : 1

For pump speeds up to 540 RPM (540 PTO) or 1,000 RPM (1,000 PTO)

<u>QTY</u>	<u>PART #</u>	<u>DESCRIPTION</u>
2	894086	4B 8.6 QD Sheave
1	980309	SK 1 3/8 QD Bushing
1	980323	SK 2 1/4 QD Bushing
4	895085	B-85 V-Belt

GROUP B - SHEAVE RATIO 1.5 : 1 (Overdrive)

For pump speeds up to 810 RPM (540 PTO) or 1500 RPM (1000 PTO)

<u>QTY</u>	<u>PART #</u>	<u>DESCRIPTION</u>
1	894110	4B 11.0 QD Sheave
1	894074	4B 7.4 QD Sheave
1	980309	SK 1 3/8 QD Bushing
1	980323	SK 2 1/4 QD Bushing
4	895085	B-85 V-Belt

GROUP C - SHEAVE RATIO 2 : 1 (Overdrive)

For pump speeds up to 1080 RPM (540 PTO)*

<u>QTY</u>	<u>PART #</u>	<u>DESCRIPTION</u>
1	894110	4B 11.0 QD Sheave
1	897560	5B 5.6 QD Sheave
1	980309	SK 1 3/8 QD Bushing
1	980323	SK 2 1/4 QD Bushing
4	895085	B-85 V-Belt

*This group not recommended for 1,000 RPM.

NOTE: Drives limited to 20 HP @ 540 RPM PTO
35 HP @ 1,000 RPM PTO

All Sheaves used on PARMA Pumps are Quick Disconnect Sheaves

MOTORS

SOFT START SINGLE PHASE 1750 RPM

OPEN DRIP PROOF

(For operation from 230 Volt 60 Hertz Single Phase Low Starting Current)

This type of motor gives reliable electric horsepower on single phase lines. Available in standard sizes 7.5 HP through 60 HP.

The motor operates on single phase through a control panel which includes matched starter and overload protection. The motor is a highly reliable polyphase induction motor with a unique winding which allows it to be operated on either single or three phase. The motor DOES NOT have to be rewound. To do this, simply reconnect the leads in the junction box.

All drip proof motors are rodent screened.

The Panel control is in a drip proof enclosure which incorporates the motor starter, motor control, and overload protection.

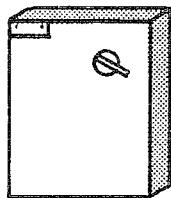

The design of this unit has been field proven. It has been in use since 1958. This system provides the answer to many power problems when only single phase service is available.

(NOTE: All motors listed below are 1750 RPM - Soft Start Motors)

Part No.	Description	Frame	Shaft	Start Amps	Full Load Amps	Approx. Wt.
890207	7.5 HP Single Phase Soft Start Motor	205TZ	1 3/8	90	30	103
